The title coordination polymer, $[\mathrm{Ni}(\mathrm{C_{10}H_8O_6})(\mathrm{C_{10}H_8N_2})$-$(\mathrm{H_2O})_2]_n$, was obtained by the hydrothermal reaction of nickel(II) sulfate, benzene-1,4-dioxydiacetic acid (*p*-phenylenedioxydiacetic acid) and 4,4′-bipyridine (4,4′-bpy) in alkaline aqueous solution. Each Ni$^{\mathrm{II}}$ atom is coordinated by two O atoms from two benzene-1,4-dioxydiacetate ligands, two N atoms from two 4,4′-bpy ligands and two water molecules, and displays a distorted octahedral geometry. The Ni$^{\mathrm{II}}$ atom and benzene-1,4-dioxydiacetate and 4,4′-bpy moieties lie on inversion centres. The benzene-1,4-dioxydiacetate ligands bridge the Ni$^{\mathrm{II}}$ atoms to form infinite zigzag chains, which are further interconnected by 4,4′-bpy ligands to form a grid-like layer parallel to the $(0\bar{1}1)$ plane. Moreover, there are O—H···O hydrogen-bonding interactions within the grid-like layer between the coordinated water molecules and the carboxylate O atoms.

Comment

Benzene-1,4-dioxydiacetic acid is an important biologically active compound that has been commonly used in herbicides and plant-growth agents. The two phenoxyacetate groups have versatile bonding modes to metal ions and easily forms complexes (Gao *et al.*, 2005; Hong *et al.*, 2006; Qiu *et al.*, 2006; Qiu *et al.*, 2007). Recently, we obtained the title nickel polymer (I), its crystal structure is reported here.

In the structure of (I) each Ni[II] atom is coordinated by two O atoms from two benzene-1,4-dioxydiacetate ligands, two N atom from two 4,4'-bpy ligands, and displays a distorted octahedral geometry. The Ni atom lies on an inversion center and benzene-1,4-dioxydiacetate and 4,4'-bpy moieties lie other inversion centers. The benzene-1,4-dioxydiacetate ligands bridge nickel ions to form infinite zigzag chains, which are further interconnected by 4,4'-bpy ligands to form a grid-like layer parallel to the (0 - 1 1) plane (Fig. 2). Moreover, there are O—H⋯O hydrogen bonding interactions within the grid-like layer between the coordinated water molecules and the carboxylate O atoms (Table 1).

Experimental

A mixture of $NiSO_4$ (0.5 mmol), benzene-1,4-dioxydiacetic acid (0.5 mmol), 4,4'-bipyridine (0.5 mmol), NaOH (1 mmol) and H_2O (12 ml) was placed in a 23 ml Teflon reactor, which was heated at 433 K for three days and then cooled to room temperature at a rate of 5 K h^{-1}. Single crystals were obtained after washing with water and drying in air.

Refinement

All H atoms attached to C atoms were fixed geometrically and treated as riding with C—H = 0.93 Å (aromatic) or 0.97 Å (methylene and U_{iso}(H) = 1.2U_{eq}(C). H atoms of water molecule were located in difference Fourier maps and included in the subsequent refinement using restraints (O—H = 0.82 (1) Å and H⋯H = 1.34 (2) Å) with U_{iso}(H) = 1.5U_{eq}(O). In the last stage of refinement, they were treated as riding on their parent O atoms.
Figures

Fig. 1. The structure of (I), showing the atom-numbering scheme and displacement ellipsoids drawn at the 30% probability level. H atoms have been omitted for clarity. [Symmetry codes: (i) -*x*, -*y* + 1, -*z* + 1; (ii) -*x* + 1, -*y* + 2, -*z* + 3; (iii) -*x*, -*y* + 2, -*z* + 2]]

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
