Received 2 November 2007; accepted 2 December 2007

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(C-C) = 0.005$ Å; disorder in solvent or counterion; R factor = 0.022; wR factor = 0.050; data-to-parameter ratio = 13.1.

In the centrosymmetric binuclear title complex, $[Pb_2(C_7H_5O_3)_4(C_{12}H_8N_2)_2(H_2O)_2] \cdot H_2O$, each Pb atom is eight-coordinated in a PbO_6N_2 environment by two N atoms from the 1,10-phenanthroline (phen) ligand, five carboxylate O atoms from four 3-hydroxybenzoate anions and one O atom from the coordinated water molecule in a distorted bicapped trigonal-prismatic geometry. The benzoate groups coordinate each Pb^{II} atom in two different ways. Two benzoate ions behave as bidentate ligands to the Pb atom, and another benzoate ion bridges the Pb atoms, forming a binuclear structure. The dimeric units are packed *via* $O-H \cdots O$ hydrogen bonds and $\pi-\pi$ interactions between the aromatic rings of neighboring molecules, with centroid-centroid distances of 3.552 (2) and 3.641 (2) Å.

Bis(μ -3-hydroxybenzoato- $\kappa^3 O, O'$: O)bis[aqua(3-hydroxybenzoato- $\kappa^2 O, O'$)(1,10-phenanthroline- $\kappa^2 N, N'$)]lead(II) monohydrate

X.-P. Xuan, P.-Z. Zhao and S.-X. Zhang

Comment

Lead(II) is capable of exhibiting a variable coordination number and geometry with or without a stereochemically active lone pair of electrons (Shimoni-Livny *et al.* 1998). Among such compounds, a number of centrosymmetric dinuclear lead(II) compounds with 1,10-phenanthroline (phen) and oxygen donor ligands have been structurally characterized (Li & Yang, 2004, Mahjoub & Morsali 2002, Zhu *et al.* 2004). Recently, we obtained the title lead(II) complex, by reaction of lead acetate, 3-hydroxybenzoate acid, sodium hydroxide and in ethanol/water mixtures. The resulting complex is different to the polymeric chain-structure we previously reported using 2-hydroxybenzoate acid instead of 3-hydroxybenzoate acid (Xuan *et al.* 2007).

The crystal structure of the title compound consists of dimeric units of $[\text{Pb}(\text{C}_7\text{H}_5\text{O}_3)_2(\text{C}_{12}\text{H}_8\text{N}_2)(\text{H}_2\text{O})]$, related by a crystallographic inversion centre (Fig. 1), and an uncoordinated (disordered) water molecule. Each lead atom is chelated by the two N atoms of 1,10-phenanthroline (phen) with Pb—N distances of 2.551 (2), and 2.583 (3) Å, and five carbonyl O atoms of 3-hydroxyl-benzoate anions, and is coordinated by the O atom of one water molecule. The shortest Pb—O distance is 2.472 (2) Å, and the longest is 2.914 (4) Å. The weak Pb—O bridging interactions form a four-membered Pb_2O_2 quadrilateral with a Pb—Pb separation of 4.1712 (8) Å. The uncoordinated water molecule is disordered over two sites close to a crystallographic inversion centre.

In the presented structure, the crystal is stabilized by intermolecular O—H \cdots O and C—H \cdots O hydrogen bonding contacts (Table 1 and Figure 2) and by two kinds of π - π stacking interactions in the sequence of benzoate - phen - phen - benzoate. The centroid-centroid distances between $Cg1(N1/C1—C4/C12)$ and $Cg2(C21—C26)$ [symmetry code: $-x, -y, 1 - z$] and between $Cg1$ and $Cg3(N1/C1—C4/C12)$ [symmetry code: $-x, 1 - y, -z$] are 3.552 (2) and 3.641 (2) Å, respectively.

Experimental

To a solution of 1,10-phenanthroline (0.0906 g, 0.5 mmol), 3-hydroxybenzoate acid(0.1394 g, 1 mmol) and sodium hydroxide (0.0185 g,0.5 mmol) in ethanol/water ($v:v=1:1,20$ ml) was added a solution of $\text{Pb}(\text{CH}_3\text{COO})_2 \cdot 3\text{H}_2\text{O}$ (0.1903 g, 0.5 mmol) in distilled water (5 ml). The resulting solution was stirred for 5 h at 323 K and then a white precipitate was filtered. Block single crystals were obtained by slow evaporation of the filtrate after 2 d, one of which was selected for the X-ray experiment.

Refinement

The carbon-bound H atoms were placed in calculated positions and were included in the refinement in the riding model approximation, with C—H = 0.93 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C aromatic})$. The hydroxyl H atoms were placed in calculated positions (O—H = 0.82 Å) and refined with free torsion angles to fit the electron density, with $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{O})$. The

supplementary materials

solvent water is disordered over two sites close to a crystallographic inversion centre, thus the site occupation factors for O8 and H3W, H4W were set 1/2. The water H atoms were restraint at distances O—H = 0.83 Å with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$, for both, the coordinated and uncoordinated water molecules.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.022$	H-atom parameters constrained
$wR(F^2) = 0.050$	$w = 1/[\sigma^2(F_o^2) + (0.0263P)^2]$
$S = 1.04$	where $P = (F_o^2 + 2F_c^2)/3$
4352 reflections	$(\Delta/\sigma)_{\max} < 0.001$
333 parameters	$\Delta\rho_{\max} = 1.06 \text{ e } \text{\AA}^{-3}$
12 restraints	$\Delta\rho_{\min} = -0.72 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
