Received 23 November 2007; accepted 26 November 2007

Key indicators: single-crystal X-ray study;  $T = 273$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å;  $R$  factor = 0.049;  $wR$  factor = 0.138; data-to-parameter ratio = 9.9.

In the title molecule,  $\text{C}_{12}\text{H}_{13}\text{N}_3\text{O}$ , the phenyl and the pyrazole rings make a dihedral angle of  $7.5(2)^\circ$ . Intermolecular  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds involving the amino group link the molecules into a three-dimensional framework.

### 3-Amino-1-phenyl-4-(propan-2-ylidene)pyrazol-5(4*H*)-one

R.-G. Zhao, J. Lu and J.-K. Li

#### Comment

Pyrazolone derivatives are well known for their applications as analgesics, antipyretics, anti-inflammatory and insecticides (Hodnett & Paul, 1972). Therefore, the study on the derivatives of pyrazolone is the focus of many research groups working in the fields of coordination chemistry, biomedicine and pharmaceutical chemistry. We report here the crystal structure of the title compound.

All geometric parameters in the title molecule (Fig. 1) are in good agreement with those found in *N*-(1,5-dihydro-1-phenyl-3-methyl-4-benzoyl)-3-chloroaniline (Wang *et al.*, 2003). The benzene and the pyrazole rings make a dihedral angle of 7.5 (2)°. Intermolecular N—H···O hydrogen bonds involving the amino group link the molecules into a three-dimensional framework (Fig. 2).

#### Experimental

3-Amino-1-phenyl-5-pyrazolone (0.175 g, 1 mmol) was added to acetone (20 ml), and the mixture was stirred under reflux at 343 K for 6 h. The solution was allowed to cool to room temperature and filtered. Orange crystals suitable for X-ray diffraction study were obtained after 7 d (yield 0.172 g, 80%; m.p. 370–372 K). Analysis found: C 66.90, H 7.02, N 19.48%; C<sub>12</sub>H<sub>13</sub>N<sub>3</sub>O requires: C 66.96, H 6.09, N 19.52%.

#### Refinement

H atoms were positioned geometrically (C—H = 0.93 – 0.96 Å and N—H = 0.86 Å) and refined as riding, with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$  and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N and C}_{\text{aromatic}})$ . In the absence of significant anomalous scattering effects, Friedel pairs were averaged.

#### Figures

Fig. 1. The molecular structure of the title compound, showing 30% probability displacement ellipsoids and the atom-numbering scheme.

Fig. 2. Crystal packing of the title compound.

Block, orange

$0.15 \times 0.12 \times 0.08\ \text{mm}$

#### Data collection

Bruker SMART CCD area-detector diffractometer

Radiation source: sealed tube

Monochromator: graphite

$T = 273\ (2)\ \text{K}$

$\varphi$  and  $\omega$  scans

Absorption correction: multi-scan (SADABS; Sheldrick, 1996)

$T_{\min} = 0.987$ ,  $T_{\max} = 0.993$

7064 measured reflections

1448 independent reflections

960 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.049$

$\theta_{\max} = 28.3^\circ$

$\theta_{\min} = 2.4^\circ$

$h = -30\text{--}30$

$k = -35\text{--}35$

$l = -10\text{--}10$

#### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.049$

$wR(F^2) = 0.138$

$S = 1.03$

1448 reflections

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0788P)^2]$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$

$\Delta\rho_{\max} = 0.15\ \text{e \AA}^{-3}$

$\Delta\rho_{\min} = -0.17\ \text{e \AA}^{-3}$

Extinction correction: none

147 parameters

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
