Received 30 October 2007; accepted 27 November 2007
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.115$; data-to-parameter ratio $=12.6$.

In the title compound, $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{4}{ }^{2+} .2 \mathrm{NO}_{3}{ }^{-}$, the organic cation is located around an inversion centre. The imidazolium ring forms a dihedral angle of 62.7 (3) ${ }^{\circ}$ with the plane defined by the C atoms of the $-\left(\mathrm{CH}_{2}\right)_{4^{-}}$aliphatic linker. Two anions bind to the cation via three-centre $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and thus discrete hydrogen-bonded ion triples are formed. The nitrate is approximately coplanar with the imidazolium ring to which it binds.

## Comment

Intermolecular hydrogen bonds are a well known and efficient tool used to regulate molecular arrangement in crystals (Holman et al., 2001). Salt formation can be driven by hydrogen bond as well (Gould, 1986). As an extension of our study on supramolecular assembly through weak interactions (Jin \& Chen, 2007a, b; Jin et al., 2007), here we report synthesis and crystal structure of 1, $1^{\prime}$-(1,4-butanediyl)bis(imidazolium) dinitrate. The crystal structure of the organic base and its 1:2 salt with hydrochloric acid has been already reported (Królikowska \& Garbarczyk, 2005).

The title compound was prepared by reacting ferric nitrate nonahydrate with 1-(4-(1H-imidazol-1-yl) butyl)-1H-imidazole. The hydrolysis of ferric nitrate nonahydrate led to nitric acid formation, which, in turn, reacted with 1-(4-( 1 H -im-idazol-1-yl)butyl)-1H-imidazole present in the reaction medium to give 2:1 salt (Fig. 1).

The protonated imidazolium rings interact with the anion via a three-center hydrogen bond with one strong and one weak component (Table 1) and the nitrate ion is practically coplanar with the imidazolium ring. On the other hand, the heterocyclic rings and nitrate anions form double-stacks extending along the [100] direction with the alternating anionic and cationic species (Fig. 2).

## Experimental

All reagents and solvents were used as obtained without further purification. The CHN elemental analyses were performed on a Perkin-Elmer model 2400 elemental analyzer.

Ferric nitrate nonahydrate ( $40.4 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) and 1-(4-(1H-imidazol-1-yl) butyl)- $1 H$-imidazole ( $57 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) in ethanol $(10 \mathrm{ml})$ were mixed and after several minutes a yellow precipitate formed. The precipitate was filtered off to yield colorless solution and the colorless solution was left standing at room temperature. In a few days colorless block crystals appeared. Yield based on 1-(4-(1H-imidazol-1-yl) butyl)- $1 H$-imidazole: $21.3 \mathrm{mg}, 28 \%$. Anal. Calculated for $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{6} \mathrm{O}_{6}$ : C, 37.94; H, 5.06; N, 26.56. Found: C, 37.88; H, 5.02; N, 26.51.

## Refinement

All H atoms were located in a difference Fourier map. H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms $(\mathrm{C}-\mathrm{H}=0.93-0.97 \AA, \mathrm{~N}-\mathrm{H}=0.86 \AA)$ with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C}, \mathrm{N})$.

## Figures

Fig. 1. The structure of the title compound, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level.

## supplementary materials

Fig. 2. Crystal packing of the hydrgen-bonded assemblies in the crystal structure of the title compound (dashed lines indicate hydrogen bonds, hydrogen atoms were omitted for clarity).

Extinction correction: none

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on F , with F set to zero for negative $\mathrm{F}^{2}$. The threshold expression of $\mathrm{F}^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
