Received 1 August 2007; accepted 27 November 2007

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(C-C) = 0.009$  Å;  $R$  factor = 0.114;  $wR$  factor = 0.354; data-to-parameter ratio = 13.0.

The molecule of the title compound,  $C_{18}H_{10}O_4$ , is centrosymmetric and planar. A long phenolic O–H bond is observed [1.19 (9) Å], which is involved in an intramolecular hydrogen bond between the phenolic and quinonoid O atoms. The molecules pack in a herringbone pattern and are linked to each other *via* intermolecular C–H···O hydrogen bonds (2.73–2.77 Å).

### Related literature

The crystal structure of the rhenium complex including the title compound has been reported (Sathyendiran *et al.*, 2007). ## 6,11-Dihydroxynaphthacene-5,12-dione

M. Tomura, H. Yamaguchi, K. Ono and K. Saito

### Comment

Organic molecules containing naphthazarin (5,8-dihydroxy-1,4-naphthoquinone) skeleton have been the attractive subject of structural investigations (Fehlmann & Nigli, 1965; Cradwick & Hall, 1971; Herbstein *et al.*, 1985; Rubio *et al.*, 1985; Sarkhel *et al.*, 2001; Savko *et al.*, 2007). The title compound, (I) (Fig. 1), is  $\pi$ -extended naphthazarin and its molecular and crystal structures are described here.

The molecule of (I) is centrosymmetric and planar, with an r.m.s deviation of 0.0098 Å from the least-squares plane for the fitted non-H atoms. The molecular structure is similar to that of naphthazarin. The symmetry of the carbon skeleton of (I) is close to  $D_{2h}$  (Table 1). The long phenolic O2—H2 bond [1.19 (9) Å] constitutes an intramolecular hydrogen bond between the phenolic O2 and quinonoid O1 atoms (Gilli *et al.*, 1989; Bertolasi *et al.*, 1991; Gilli *et al.*, 1993; Steiner & Saenger, 1994). These facts imply that the structure of (I) can be interpreted not as 1,4- nor 1,5-quinone but as resonance between two zwitterion contributors, as shown in Scheme 1 (Cradwick & Hall, 1971; Shiau *et al.*, 1980).

In the crystal structure, the molecules form a herringbone-type stacking along the *b* axis, where the distance between the molecular planes is 3.42 Å (Fig. 2). The packing mode is similar to that characteristic of aromatic hydrocarbon atoms. The intermolecular C—H···O hydrogen bonds (Taylor & Kennard, 1982; Jagarlapudi & Desiraju, 1987; Biradha *et al.*, 1993; Batchelor *et al.*, 2000) are found between the herringbone-type stackings (Table 2). Similar C—H···O hydrogen bonds (2.54–3.01 Å) were observed in the crystal structure of naphthazarin (Cradwick & Hall, 1971).

### Experimental

The title compound (I) was commercially available. Red crystals of (I) suitable for X-ray analysis were grown from a chloroform solution.

### Refinement

The H atom bonded to the phenolic O atom was located in a difference map and refined isotropically. Other H atoms were positioned geometrically refined using a riding model with C—H = 0.95 Å and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

### Figures

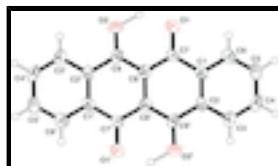

Fig. 1. The molecular structure of (I), with atom labels and 50% probability displacement ellipsoids for non-H atoms and H atoms are shown as small spheres of arbitrary radii [symmetry code: (i)  $-x, -y, -z + 1$ ].

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.114$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.354$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.99$	$w = 1/[\sigma^2(F_o^2) + (0.1532P)^2 + 1.2875P]$ where $P = (F_o^2 + 2F_c^2)/3$
1347 reflections	$(\Delta/\sigma)_{\text{max}} = 0.053$
104 parameters	$\Delta\rho_{\text{max}} = 0.52 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.32 \text{ e \AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
