## 3-[(Hydroxy)(4-isopropoxy-2-methoxyphenyl)methylene]-1-isopropylpyrrolidine-2,4-dione

Hai-zhen Xu,<sup>a\*</sup> You-quan Zhu,<sup>b</sup> Yu-hong Xiao<sup>b</sup> and Ran Zhu<sup>b</sup>

<sup>a</sup>College of Chemistry and Life Sciences, Tianjin Normal University, Weijin Road No. 241, Tianjin, People's Republic of China, and <sup>b</sup>State Key Laboratory of Elemento-Organic Chemistry, Nankai University, Tianjin 300071, People's Republic of China  
Correspondence e-mail: hxsxyzhz@mail.tjnu.edu.cn

Received 17 November 2007; accepted 19 November 2007

Key indicators: single-crystal X-ray study;  $T = 294$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.044;  $wR$  factor = 0.131; data-to-parameter ratio = 16.2.

The title compound,  $\text{C}_{18}\text{H}_{23}\text{NO}_5$ , a potential herbicide, has an enol group that is intramolecularly hydrogen bonded to a keto O atom. The dihedral angle between the six-membered ring formed by the enol group and the aromatic benzene ring is  $53.35(6)^\circ$ .

### 3-[(Hydroxy)(4-isopropoxy-2-methoxyphenyl)methylene]-1-isopropylpyrrolidine-2,4-dione

H. Xu, Y. Zhu, Y. Xiao and R. Zhu

#### Comment

Many compounds containing the 3-acylpyrrolidine-2,4-dione system belong to heterocycles with antibiotic activity, such as tenuazonic acid (Stickings, 1959), streptolydigin (Rinehart *et al.*, 1963), tirandamycin (Rinehart *et al.*, 1971), malonomycin (Van Der Baan *et al.*, 1978), alpha-cyclopiazonic acid (Stickings, 1959; van Rooyen, 1992) and bata-cyclopiazonic acid (Holzapfel *et al.*, 1970). All these compounds possess a 3-acyltetramic acid grouping as a tricarbonylmethane fragment. Most of the excellent inhibitors of *p*-hydroxyphenylpyruvate dioxygenase also possess similar characteristics, which are crucial for their two kinds of bioactivity (Zhu, Hu & Yang, 2004). In order to develop new herbicides, we synthesized the title compound. The molecular structure of the title compound is shown in Fig. 1. Atom H3, involved in intramolecular hydrogen bonding between atoms O3 and O4, was assigned to O3 rather than to O4. The C13=O4 distance is 1.251 (2) Å, which is longer than the normal carbonyl bond length (C13=O1) of 1.219 (2) Å. In contrast, the C11=O3 distance [1.318 (2) Å] is intermediate between a normal carbonyl C=O double bond and a C—O single-bond length (Allen *et al.*, 1987) (Table 1). A similar situation was reported for 3-(1-hydroxyethylidene)-1-phenylpyrrolidine-2,4-dione (Ellis & Spek, 2001), 1-benzyl-3-(alpha-hydroxybenzylidene)pyrrolidine-2,4-dione, (I) (Zhu, Song, Li *et al.*, 2004), 1-*tert*-butyl-3-(alpha-hydroxy-4-isopropylbenzylidene)pyrrolidine-2,4-dione, (II) (Xu, 2005), and 3-(alpha-hydroxyl-2-methoxybenzylidene)-1-isopropylpyrrolidine-2,4-dione, (III) (Zhu, Song, Yao *et al.*, 2004). The dihedral angle formed by the enol ring A with the benzene ring is 53.35 (6)°, which is larger than the dihedral angles for (I), (II) (10 and 21°, respectively) and smaller than the dihedral angle for (III) (53°). The crystal structure of the title compound also involves a weak intramolecular C—H...O hydrogenbonding interactions (Table 2).

#### Experimental

The title compound was obtained according to the procedure reported by Matsuo *et al.* (1980). Colourless single crystals of the title compound were obtained by recrystallization of 1-isopropyl-3-(alpha-hydroxy-4-isopropoxy-2-methoxybenzylidene) pyrrolidine-2,4-dione from petroleum ether and ethyl acetate(1:3).

#### Refinement

All H atoms were placed in calculated positions, with C—H = 0.93 or 0.96 Å and O—H = 0.82 Å, and included in the final cycles of refinement using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}(\text{O})$ . Friedel pairs were not merged.

#### Figures

Fig. 1. View of the title compound, with displacement ellipsoids drawn at the 30% probability level.

## 3-[(Hydroxy)(4-isopropoxy-2-methoxyphenyl)methylene]-1- isopropylpyrrolidine-2,4-dione

### Crystal data

$C_{18}H_{23}NO_5$	$Z = 8$
$M_r = 333.37$	$F_{000} = 1424$
Monoclinic, $C2/c$	$D_x = 1.248 \text{ Mg m}^{-3}$
Hall symbol: $-C 2yc$	Mo $K\alpha$ radiation
$a = 14.694 (2) \text{ \AA}$	$\lambda = 0.71073 \text{ \AA}$
$b = 12.249 (2) \text{ \AA}$	$\theta = 2.6\text{--}23.1^\circ$
$c = 20.308 (3) \text{ \AA}$	$\mu = 0.09 \text{ mm}^{-1}$
$\beta = 103.864 (3)^\circ$	$T = 294 (2) \text{ K}$
$V = 3548.5 (10) \text{ \AA}^3$	Prism, colourless
	$0.26 \times 0.24 \times 0.20 \text{ mm}$

### Data collection

Bruker SMART CCD area-detector diffractometer	2199 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}} = 0.032$
Monochromator: graphite	$\theta_{\text{max}} = 26.4^\circ$
$T = 294(2) \text{ K}$	$\theta_{\text{min}} = 2.1^\circ$
$\varphi$ and $\omega$ scans	$h = -18 \rightarrow 8$
Absorption correction: none	$k = -15 \rightarrow 15$
9820 measured reflections	$l = -24 \rightarrow 25$
3622 independent reflections	

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.044$	H-atom parameters constrained
$wR(F^2) = 0.131$	$w = 1/[\sigma^2(F_o^2) + (0.066P)^2 + 0.41P]$
$S = 1.04$	where $P = (F_o^2 + 2F_c^2)/3$
3622 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
223 parameters	$\Delta\rho_{\text{max}} = 0.19 \text{ e \AA}^{-3}$
12 restraints	$\Delta\rho_{\text{min}} = -0.20 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
