Received 12 December 2007; accepted 3 January 2008

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.032; wR factor = 0.088; data-to-parameter ratio = 12.7.

The title compound, $[\text{Mn}_2(\text{C}_{18}\text{H}_{18}\text{N}_2\text{O}_2)_2\text{Cl}_2]$, was synthesized by the reaction between manganese(II) *o*-chlorobenzoate and the Schiff base generated *in situ* by the condensation of ethane-1,2-diamine and *o*-hydroxyacetophenone. The centrosymmetric dimer contains two Jahn–Teller-distorted manganese(III) ions, each in an octahedral geometry, connected through two phenoxy bridges from two ligands.

Bis{ μ -2,2'-[1,1'-(ethane-1,2-diyl)dinitrilo]diethylidyne]diphenolato- κ^5 O,N,N',O':O}bis[chloridomanganese(III)]

V. S. Thampidas, T. Radhakrishnan and R. D. Pike

Comment

Manganese coordination chemistry, in recent decades, has been in intense research focus in connection with developments in diverse fields as bioinorganic modeling (Triller *et al.*, 2002), asymmetric catalysis (Larow & Jacobsen, 2004), molecular magnetism (Christou, 2005) *etc.* Schiff base ligands with nitrogen and oxygen donor atoms seem to stabilize the various oxidation states of manganese better than any other ligand systems, as it is evident from the sheer number of publications in this area (Vites & Lynam, 1998). The penta-coordinate [Mn(salen)Cl] (H₂salen = *N,N'*-bis(salicylidene)-1,2-diaminoethane) was one of the earliest crystallographically characterized manganese(III) Schiff base complexes (Pecoraro & Butler, 1986). This may be considered as a prototype molecule, that has led to the development of large number of manganese(III) complexes with a square planar MnN₂O₂ core, stabilized by a chiral-salen ligand and a chloride ion in the axial position (Zhang *et al.*, 1990; Jacobsen *et al.*, 1991). In our effort to synthesize dimeric manganese(III) complexes of a salen-like ligand, *N,N'*-bis(*o*-hydroxyacetophenonylidene)-1,2-diaminoethane with *o*-chlorobenzoate as an ancillary ligand, we unexpectedly obtained a dimeric manganese(III) complex stabilized by the Schiff base and two axial chloride ligands. Here we report the crystal structure of the new dichloride dimer (Fig. 1).

In the title compound, the centrosymmetric dimer is crystallographically half independent and consists of two Mn^{III} atoms, linked by two phenolic O atoms of two ligands. Two Mn—N bonds and two Mn—O bonds complete the equatorial square plane geometry around the Mn^{III} atom (Table 1). This leaves the two axial positions open for coordination to the Cl atoms, leading to the formation of a rare dichloride dimer. Jahn-Teller distortion elongates the Mn—Cl bond [Mn1—Cl1 = 2.4633 (6) Å] substantially, which is comparable to the Mn—Cl bond length of 2.461 (1) Å in the square pyramidal [Mn(salen)Cl] (Pecoraro & Butler, 1986). But the elongation is not as much as seen in the square pyramidal [Mn(5—Cl-salen)Cl] (Horwitz *et al.*, 1995) and octahedral [Mn(salen)Cl(H₂O)] (Panja *et al.*, 2003), where Mn—Cl distances are 2.572 (1) Å and 2.621 (6) Å, respectively. Jahn-Teller effect is also apparent in the longer Mn—O bond [Mn1—O1 = 2.4720 (16) Å] of the Mn₂(μ -O)₂ diamond core of the dimer. This makes the Mn—O—Mn bridge of the complex considerably weaker than that in the diazide dimer [Mn₂(L)₂(N₃)₂] (H₂L = *N,N'*-bis(*o*-hydroxyacetophenonylidene)-1,2-diaminoethane) (Saha *et al.*, 2004), where the corresponding bond length is 2.375 (5) Å. The Mn...Mn separation in the title compound is 3.453 (2) Å, compared to 3.341 (2) Å in [Mn₂(L)₂(N₃)₂].

Experimental

To a solution of Mn(*o*-Cl—C₆H₄CO₂)₂·2H₂O (1.00 g, 2.49 mmol) and *o*-hydroxyacetophenone (0.68 g, 4.98 mmol) in methanol (40 ml), ethane-1,2-diamine (0.14 g, 2.49 mmol) was added. The solution was stirred for 20 min, filtered and left to evaporation in an open conical flask. Brown crystals were deposited in 2–3 days. These were collected by filtration, washed with methanol, and dried in air (yield 0.80 g, 80.6% based on Mn).

Refinement

H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.95 (CH) and 0.99 Å (CH₂) and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$, and with C—H = 0.98 Å (CH₃) and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$.
