Received 19 December 2007; accepted 28 December 2007

 Key indicators: single-crystal X-ray study;  $T = 150$  K; mean  $\sigma(\text{C}-\text{C}) = 0.008$  Å;  $R$  factor = 0.059;  $wR$  factor = 0.177; data-to-parameter ratio = 14.2.

In the title compound,  $[\text{Fe}(\text{C}_5\text{H}_5)(\text{C}_6\text{H}_{16}\text{P}_2)(\text{CO})](\text{C}_{12}\text{H}_{13}\text{BOP})$ , the  $\text{Fe}^{\text{II}}$  ion adopts a three-legged piano-stool geometry, with  $\text{Fe}\cdots\text{Cg} = 1.721$  (5) Å ( $\text{Cg}$  = the centroid defined by the C atoms of the cyclopentadienyl ring). The 1,2-bis(dimethylphosphino)ethane (dmpe) ligand chelates to form a five-membered  $\text{C}_2\text{P}_2\text{Fe}$  ring which is in a pseudo-half-chair conformation. In the crystal structure, associations of one cation and two anions are formed *via* weak intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, giving rise to  $R_4^2(9)$  rings.

## [1,2-Bis(dimethylphosphino)ethane]carbonyl( $\eta^5$ -cyclopentadienyl)iron(II) diphenylphosphinoylborate

K. Lee, A. J. Lough and I. Manners

### Comment

The mechanism for the metal catalyzed dehydrocoupling of phosphine-borane adducts has been studied by investigating the synthesis and reactivity of model complexes. The P—H bond oxidative addition of RPhPH-BH<sub>3</sub> to Pt(PEt<sub>3</sub>)<sub>3</sub> has been reported as well as the phosphine-borane ligand-exchange reaction at the Pt centre of *cis*-[PtH(PPh<sub>2</sub>.BH<sub>3</sub>) (depe)] (Jaska *et al.*, 2003). Model complexes such as *cis*-[PtH(PPhH.BH<sub>3</sub>)(dcype)] [dcype = 1,2-bis(dicyclohexylphosphino)ethane] have been synthesized *via* dehydrocoupling routes involving Pt—H and P—H bonds of *cis*-[PtH<sub>2</sub>(dcype)] and PhPH<sub>2</sub>.BH<sub>3</sub> respectively (Jaska *et al.*, 2005). The reactivity of CpFe(CO)<sub>2</sub>PPh<sub>2</sub>.BH<sub>3</sub>, (I), (Kuckmann *et al.*, 2007) [see Fig. 3] was probed as a potential model complex in the study of the mechanism of the dehydrocoupling of phosphine-borane adducts: the CO ligands might dissociate to promote a reaction with phosphine-borane adducts. Before reacting (I) with phosphine-borane adducts, dmpe (1,2-bis(dimethylphosphino)ethane) was added in excess to (I) to observe the lability of the CO ligands. When adventitious air was also introduced to this reaction in THF, the title compound, (II), (Fig. 1), was formed. A similar complex, Cp\*Fe(dmpe)X (X = H, CH<sub>3</sub> or Cl) was reported earlier (Paciello *et al.*, 1990).

The Fe atom in (II) is bonded to a cyclopentadienyl (cp) ring with Fe...C<sub>g</sub> = 1.721 (5) Å (C<sub>g</sub> = the centroid of C1—C5), a carbonyl group and the bis-chelating (dimethylphosphino)ethane (dmpe) ligand (Table 1). In the crystal of (II), weak intermolecular C—H...O hydrogen bonds (Table 2) form rings with graph set assignment *R*<sup>2</sup><sub>4</sub>(9) (Bernstein *et al.*, 1995) created in a three component cluster of two anions and one cation (Fig. 2).

### Experimental

The complex CpFe(CO)<sub>2</sub>PPh<sub>2</sub>.BH<sub>3</sub> (200 mg, 0.532 mmol) was dissolved in 1.8 ml THF in a round bottom Schlenk flask. This yellow solution turned orange upon addition of dmpe (0.150 ml, 0.899 mmol). After 8 days of stirring at 293 K, orange precipitate was observed in the solution. The solution was filter cannulated into a new flask and then the volatile components of the reaction mixture were removed *in vacuo* overnight. The product was purified by chromatography with a column of celite (0.5 cm × 1.5 cm) supported on glass wool with hexanes (4 ml), Et<sub>2</sub>O (5 ml) and then THF (4 ml). The product in THF afforded pale yellow needles of (II) due to adventitious air.

### Refinement

All hydrogen atoms bonded to C were placed in calculated positions with C—H = 0.95–1.00 Å and refined as riding with *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(C) or 1.5*U*<sub>eq</sub>(C<sub>methyl</sub>). The H atoms bonded to B1 were refined independently with isotropic displacement parameters.

## Figures

Fig. 1. The molecular structure of (II) with displacement ellipsoids drawn at the 30% probability level. H atoms bonded to C atoms are not shown.

Fig. 2. Part of the crystal structure of (II) showing hydrogen bonds as thin lines. Only the H atoms bonded to B atoms and those involved in hydrogen bonding are shown.

Fig. 3. The reaction scheme.

*Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.058$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.176$	$w = 1/[\sigma^2(F_o^2) + (0.0844P)^2 + 1.3773P]$
$S = 1.05$	where $P = (F_o^2 + 2F_c^2)/3$
4217 reflections	$(\Delta/\sigma)_{\max} = 0.002$
296 parameters	$\Delta\rho_{\max} = 0.81 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.79 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
