Received 16 November 2007; accepted 20 November 2007

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; disorder in solvent or counterion; R factor = 0.037; wR factor = 0.117; data-to-parameter ratio = 11.2.

In the title compound, $\text{C}_{10}\text{H}_{11}\text{N}_2^+ \cdot \text{PF}_6^- \cdot \text{C}_{10}\text{H}_{10}\text{N}_2$, the H atom involved in protonation is disordered equally between the cation and the neutral molecule. The dihedral angle between the phenyl and imidazole rings is $82.6(2)^\circ$. In the crystal structure, there are head-to-tail π - π stacking interactions between imidazole rings; the interplanar separation is $3.295(1)$ Å and the centroid-centroid separation is $3.448(3)$ Å. In the centrosymmetric anion, two F atoms are disordered over two positions; the refined site-occupancy factors are 0.855(11) and 0.145(11).

1-Benzylimidazolium hexafluorophosphate-1-benzylimidazole (1/1)

Y. Zang, X.-M. Wu, Z.-Y. Zheng, H.-B. Song and Q.-X. Liu

Comment

Some weak interactions in crystal engineering, such as π - π stacking interactions (Hunter & Sanders, 1990), often affect the structure of complexes, and they can link discrete sub-units or low-dimensional entities into high-dimensional supramolecular networks. The imidazole ring is a structural component of many compounds occurring in living organisms (Sundberg & Martin, 1974). In the mechanisms of the majority of enzymatic reactions, an important role is played by the formation of coordination compounds with ions (Kurdziel & Glowiak, 2000.). We are interested in imidazole compounds with π - π stacking interactions and here report the synthesis and crystal structure of 1-benzylimidazolium hexafluoridophosphate.

In the title compound, $C_{10}H_{10}N_2 \cdot C_{10}H_{11}N_2^+ \cdot F_6P^-$, atom H2 is disordered equally between the cation and neutral molecule. The dihedral angle between the phenyl and imidazole rings is $82.6(2)^\circ$ (Fig. 1). The N1A—C1A, N1A—C3A, N2A—C1A and N2A—C2A bond distances are 1.312 (2), 1.368 (3), 1.308 (3) and 1.355 (3) Å, respectively, and the N1A—C1A—N2A bond angle is $108.78(18)^\circ$; these values are similar to those observed in 1-(9-anthracenylmethyl)-3-ethylimidazolium iodide (Liu *et al.*, 2003).

In the crystal structure of the title compound (Fig. 2), there are head-to-tail π - π stacking interactions between imidazole rings; the interplanar separation is 3.295 (1) Å and the centroid-to-centroid separation is 3.448 (3) Å.

Experimental

A 1,4-dioxane solution (20 ml) of imidazole (1.420 g, 20.8 mmol) was added to a suspension of oil-free sodium hydride (0.500 g, 20.8 mmol) in 1,4-dioxane (20 ml) and stirred for 1 h at 90°C . A 1,4-dioxane (20 ml) solution of benzyl bromide (3.240 g, 19 mmol) was then added dropwise to the above solution. The mixture was stirred for 22 h at 90°C , and a brown solution was obtained. The solvent was removed with a rotary evaporator and H_2O (50 ml) was added to the residue. The solution was then extracted with CH_2Cl_2 (50 ml), and the solution was dried with anhydrous MgSO_4 . After removing CH_2Cl_2 , 1-benzylimidazole, as a pale yellow liquid was obtained yield: 2.7 g (89.7%).

1-Benzylimidazole (2.000 g, 12.6 mmol) was reacted with hydrochloric acid (8 ml, 6 mol l^{-1}) to afford 1-benzylimidazolium chloride as a pale yellow solid (2.618 g, 94%). NH_4PF_6 (5.050 g, 31 mmol) was added to a methanol solution (50 ml) of 1-benzylimidazolium chloride (2.000 g, 10.3 mmol). A pale yellow precipitate formed immediately, which was collected by filtration, washed with small portions of methanol, and dried in a vacuum to give 1-benzylimidazolium hexafluoridophosphate as a pale yellow powder (3.3 g, 95%). m.p. $202\text{--}204^\circ\text{C}$. Crystals suitable for X-ray diffraction were obtained by evaporating slowly a CH_3OH solution at room temperature.

Refinement

All H atoms were initially located in a difference Fourier map. They were then placed in geometrically idealized positions and constrained to ride on their parent atoms, with $C_{sp^3}-H = 0.97 \text{ \AA}$, $C_{sp^2}-H = 0.93 \text{ \AA}$ and $N-H = 0.86 \text{ \AA}$ and $U_{iso}(H) = 1.2U_{eq}(C,N)$. In the centrosymmetric anion, atoms F2 and F3 are disordered over two positions; the refined site occupancy factors are 0.855 (11) and 0.145 (11). Atom H2 is disordered equally between the cation and the neutral molecule.

Figures

Fig. 1. Perspective view of the title compound, with displacement ellipsoids drawn at the 30% probability level. The organic moiety with A atom labels is the cation; that with B atom labels is the centrosymmetrically related neutral molecule. In the centrosymmetric anion, only one disorder component is shown.

Fig. 2. The π - π stacking interaction between imidazole rings in the title compound.

$\theta_{max} = 25.0^\circ$

$\theta_{min} = 1.8^\circ$

$h = -6 \rightarrow 7$

$k = -8 \rightarrow 8$

$l = -26 \rightarrow 21$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.116$	$w = 1/[\sigma^2(F_o^2) + (0.0633P)^2 + 0.4527P]$
$S = 1.05$	where $P = (F_o^2 + 2F_c^2)/3$
1820 reflections	$(\Delta/\sigma)_{\max} < 0.001$
162 parameters	$\Delta\rho_{\max} = 0.23 \text{ e } \text{\AA}^{-3}$
2 restraints	$\Delta\rho_{\min} = -0.46 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
	Extinction coefficient: 0.013 (3)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
