Received 7 December 2007; accepted 7 March 2008

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.026; wR factor = 0.068; data-to-parameter ratio = 11.9.

In the title coordination polymer, $\{[\text{Ba}(\text{C}_7\text{H}_2\text{N}_2\text{O}_7)(\text{H}_2\text{O})_2]\cdot\text{H}_2\text{O}\}_n$, the Ba^{II} atom is ten-coordinated by seven O atoms from four 3,5-dinitrosalicylata ligands, two μ_2 -bridging aqua ligands and one water molecule. The coordination mode is best described as a bicapped square-antiprismatic geometry. The 3,5-dinitrosalicylata ligands bridge three Ba atoms. Centrosymmetrically related dinuclear barium units, with a $\text{Ba}\cdots\text{Ba}$ separation of 4.767 (5) Å, form infinite chains, which are further self-assembled into a supramolecular network through intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen-bonding interactions between O atoms of 3,5-dinitrosalicylata ligands and water molecules.

Poly[μ_2 -aqua-aqua(μ_3 -3,5-dinitrosalicylato)barium(II)] monohydrate]

W.-D. Song, R.-Z. Fan, C.-S. Gu and X.-M. Hao

Comment

In the structural investigation of 3,5-dinitrosalicylato complexes, it has been found that the 3,5-dinitrosalicylato moiety functions as a multidentate ligand (Song *et al.*, 2007) with versatile binding and coordination modes. In this paper, we report the crystal structure of the title compound, (I), a new Ba complex obtained by the reaction of 3,5-dinitrosalicylic acid and barium chloride in alkaline aqueous solution.

As illustrated in Figure 1, the Ba^{II} atom displays a bicapped square antiprismatic coordination environment, defined by seven O atoms from four 3,5-dinitrosalicylato ligands, two μ_2 -bridging aqua ligands and one water molecule. The 3,5-dinitrosalicylato ligands link barium ions to form infinite chains, which are further self-assembled into a supramolecular network through intermolecular O—H···O hydrogen bonding interactions (Table 1) involving the uncoordinating water molecules, coordinating water molecules as donors and O atoms of 3,5-dinitrosalicylato ligands as acceptors (Fig. 2).

Experimental

A mixture of barium chloride (1 mmol), 3,5-dinitrosalicylic acid (1 mmol), NaOH (1.5 mmol) and H₂O (12 ml) was placed in a 23 ml Teflon reactor, which was heated to 433 K for three days and then cooled to room temperature at a rate of 10 K h⁻¹. The obtained crystals obtained were washed with water and dried in air.

Refinement

Carbon-bound H atoms were placed at calculated positions and were treated as riding on the parent C atoms with C—H = 0.93 Å, and with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. Water H atoms were tentatively located in difference Fourier maps and were refined with distance restraints of O—H = 0.84 Å and H···H = 1.39 Å, each within a standard deviation of 0.01 Å, and with $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{O})$.

Figures

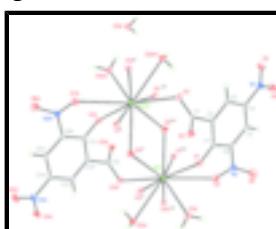

Fig. 1. The structure of (I), showing the atomic numbering scheme. Non-H atoms are shown with 30% probability displacement ellipsoids.

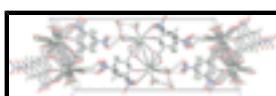

Fig. 2. A packing view of the title compound. The intermolecular hydrogen bonds are shown as dashed lines.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
