Received 22 February 2008; accepted 27 February 2008

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.050; wR factor = 0.132; data-to-parameter ratio = 19.1.

The title compound, $\text{C}_{20}\text{H}_{32}\text{N}_2\text{O}_2\text{S}_2$, has been synthesized by the reaction of α -methylsulfanylcyclododecanone and *p*-toluenesulfonylhydrazine. In the crystal structure, the conformation of the non-benzenoid ring is [3333] and the methylsulfanyl group is in the α -side *exo* position. The molecules are linked by intermolecular N—H···S hydrogen bonds.

2-(Methylsulfanyl)cyclododecanone tosylhydrazone

X.-J. Yan, X.-M. Liang, S.-H. Jin and D.-Q. Wang

Comment

Many derivatives of cyclododecanone have bioactivity that has attracted much attention from chemists (Song *et al.*, 2005; Li *et al.*, 2005). In order to understand the structure-activity relationships of these materials, it is necessary to study their stereochemistry and overall conformation. We have studied a number of α -monosubstituted cyclododecanones with some fruitful results (Wang *et al.*, 2002; Lu *et al.*, 2004). Recently, we found a very interesting conformational phenomenon in the condensation products resulting from the reactions of α -monosubstituted cyclododecanones with hydroxylamine and thiosemicarbazide (Wang *et al.*, 2007). In these compounds the parent ring has a [3333] conformation and the substituting group is at the α -side-*exo* or α -corner-*anti*position. These results were rationalized by "corner-position carbonyl participation" of raw materials, memory effects and H-bonding between amine derivatives and α -monosubstituted cyclododecanones. To further understand the above results, we synthesized the title compound (I) by the reaction of α -methylsulfanylcyclododecanone and *p*-toluenesulfonylhydrazine. The X-ray analysis further confirmed the validity of our proposed explanation.

The molecular structure of the title compound is given in Fig. 1. In the crystal, the parent ring has the [3333] conformation found in the other molecules and the methylsulfanyl group is at α -side-*exo* position. The molecules are linked by intermolecular N—H···S hydrogen bonds (Table 1 and Fig. 2).

Experimental

α -Methylsulfanylcyclododecanone (228 mg, 1.0 mmol) was dissolved in 10 ml absolute ethanol along with *p*-toluenesulfonylhydrazine (279 mg, 1.5 mmol) and a catalytic amount of *p*-toluenesulfonic acid. The reaction mixture was heated to reflux under nitrogen for 5 h and cooled. After removal of the solvent under reduced pressure, the crude product was purified by column chromatography on silica gel (200–300 mesh) using hexane/ethyl acetate (10:1, v/v) as the eluent, and recrystallized from methanol to give a pure colorless crystal (yield 76%, m.p. 136–138 °C) suitable for X-ray diffraction.

Refinement

All non-hydrogen atoms were refined with anisotropic displacement parameters. The carbon-bound H atoms were placed at calculated positions, with C—H = 0.93–0.98 Å, and included in the final cycles of refinement using a riding model with U_{iso} (H) = 1.2 or 1.5(methyl) U_{eq} (parent atom). The H atoms attached to N2 was located in a difference Fourier map, and was refined with a distance of N—H 0.85 (1) Å.

Figures

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
