Received 29 November 2007; accepted 13 February 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å;
disorder in main residue; R factor = 0.051; wR factor = 0.152; data-to-parameter ratio = 11.8.

The title complex, $C_{26}H_{38}N_4O_4$, was synthesized by the reaction of 4-diethylamino-2-hydroxybenzaldehyde with 1,4-bis(aminooxy)butane in ethanol. It crystallizes as discrete centrosymmetric molecules adopting an extended conformation where the two salicylaldoxime groups are separated from each other. Intramolecular O—H \cdots N hydrogen bonding is observed between the hydroxy groups and oxime N atoms. Intermolecular π — π stacking interactions [3.979 (2) Å] between aromatic rings are apparent in the crystal structure. Each ethyl group is disordered over two positions; in one the site occupancy factors are 0.55 and 0.45, in the other 0.53 and 0.47.

Comment

A great deal of attention has recently been attracted to the study of salen and its derivatives (Boghæi *et al.*, 2006; Abu-Surrah *et al.*, 1999) due to the ease of formation of metal complexes which model reaction centers of metalloenzymes. These compounds also have excellent magnetic properties (Costes *et al.*, 2000) and form nonlinear optical materials (Lacroix, 2001). Recently, we have reported some salen-type bisoxime derivatives (Dong, Duan *et al.*, 2007; Dong, He *et al.*, 2007; Zhang *et al.*, 2007). Now, the title compound, (I) was synthesized and its crystal structure determined. (Fig. 1). The molecule of (I) is disposed about a crystallographic centre of symmetry, and adopts an extended conformation with the two salicylaldoxime groups separated from each other.

The oxime groups and phenolic groups adopt a *trans* conformation about the C=N bond, and there is a strong O—H···N intramolecular hydrogen bond, O2—H2···N1 ($d(\text{O}2\text{---H}2) = 0.820 \text{ \AA}$, $d(\text{H}2\cdots\text{N}1) = 1.913 \text{ \AA}$, $d(\text{O}2\cdots\text{N}1) = 2.639(2) \text{ \AA}$, $\angle\text{O}2\text{---H}2\cdots\text{N}1 = 147.01^\circ$). The carbon atoms of *N,N*-diethylamino of the ligands (C10, C11, C12, C13 and C10', C11', C12', C13') are disordered over two different positions, which were allowed for during refinement.

Experimental

5,5'-di(*N,N*-diethylamino)-2,2'-(1,4-butylene) dioxybis(nitrilomethylidyne)]diphenol was synthesized according to a method reported earlier (Zhang *et al.*, 2007). To an ethanol solution (5 ml) of 4-(*N,N*-diethylamino)-2-hydroxybenzaldehyde (398.07 mg, 2.06 mmol) was added an ethanol (3 ml) solution of 1,4-bis(aminoxy)butane (121.66 mg, 1.03 mmol). The solution was stirred at 328 K for 4 h, then concentrated to about 2 ml under reduced pressure, and washed successively with ethanol and hexane, respectively. The product was dried under vacuum and purified with recrystallization from ethanol to yield 436.26 mg of the title compound. Yield, 45%. mp. 397–398 K. Anal. Calc. for $C_{26}H_{38}N_4O_4$: C, 66.36; H, 8.14; N, 11.91%. Found: C, 66.25; H, 8.08; N, 12.07%. Colorless prismatic single crystals suitable for X-ray diffraction studies were obtained after about two weeks by slow evaporation of (I) at room temperature from an acetone/chloroform solution.

Refinement

H atoms were treated as riding atoms with distances C—H = 0.97 (CH₂), or 0.93 Å (CH), O—H = 0.82 Å, and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ and $1.5 U_{\text{eq}}(\text{O})$. The hydroxyl protons were located directly from a Fourier difference map. Each ethyl group is disordered over two positions; in one the site occupancy factors are 0.55 and 0.45, in the other 0.53 and 0.47.

Figures

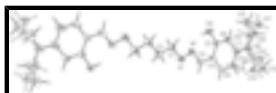

Fig. 1. The molecule structure of (I) with atom labelling and displacement ellipsoids at the 30% probability level for non-hydrogen atoms.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.051$	H-atom parameters constrained
$wR(F^2) = 0.152$	$w = 1/[\sigma^2(F_o^2) + (0.0421P)^2 + 0.5356P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\text{max}} = 0.001$
2303 reflections	$\Delta\rho_{\text{max}} = 0.12 \text{ e \AA}^{-3}$
196 parameters	$\Delta\rho_{\text{min}} = -0.15 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
