Key indicators: single-crystal X-ray study;  $T = 133\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.074;  $wR$  factor = 0.272; data-to-parameter ratio = 19.6.

In the title compound,  $\text{C}_{48}\text{H}_{64}\text{O}_4 \cdot 0.5\text{CH}_2\text{Cl}_2$ , both crystallographically independent calixarene molecules display a partial cone conformation. Their crystal packing is stabilized by  $\text{C}-\text{H} \cdots \pi$  contacts involving the methoxy groups. The solvent molecule is located interstitially between two calixarene units with  $\text{C}-\text{H} \cdots \text{Cl}$  contacts to methoxy and *tert*-butyl groups. One *tert*-butyl residue of each calixarene molecule is disordered over two positions (occupancies 0.60/0.40 and 0.63/0.37), resulting in bond distances that deviate from ideal values. The tetramer calixarene molecules present models with approximate non-crystallographic  $C_s$  symmetry.

## Related literature

The solvent-free title compound has been described to assume a *partial cone* conformation (Grootenhuis *et al.*, 1990). A closely related solvate with THF has been described previously (Fischer *et al.*, 2007, and literature cited therein). For the synthesis of the compound, see: Bitter *et al.* (1995). For other related literature, see: Gutsche *et al.* (1983), Iwamoto *et al.* (1991); Nishio (2004).

### Comment

The molecular geometry of the calixarene (Figure 1) is best described by a *partial cone* conformation with opposite arene rings A and C differing only little from coplanarity [5.6 (1) and 9.2 (1) $^{\circ}$ , respectively], whereas the aromatic rings B and D include dihedral angles of 54.9 (1) and 58.4 (1) $^{\circ}$ , respectively. The solvent molecules are everything but located inside of the calixarene cavity offering not enough space for an accommodation. Hence the CH<sub>2</sub>Cl<sub>2</sub> molecule occupies interstitial lattice space between two calixarene molecules (Figure 2). Due to their hydrophobic surface, the packing of the calixarene molecules is primarily stabilized by van-der-Waals interactions and weak C—H··· $\pi$  contacts (Nishio, 2004) involving methoxy groups and neighboring aromatic rings, with H··· $\pi$  (centroid of the aromatic ring) distances ranging from 2.64 to 2.93  $\text{\AA}$ . Furthermore, weak C—H···Cl interactions including one of the methoxy groups [ $d(\text{C}33\text{A}\cdots\text{Cl}1\text{G}) = 3.6554 \text{\AA}$ ] and a *tert*-butyl group [ $d(\text{C}46\cdots\text{Cl}2\text{G}) = 3.4833 \text{\AA}$ ] can be observed (Table 1). The *tert*-butyl residues are partially disordered over two positions [0.60/0.40 (ring D), 0.63/0.37 (ring B')], resulting in bond distances that deviate from ideal values.

### Experimental

The title calixarene was synthesized from 5,11,17,23-tetra-*tert*-butyl-25,26,27,28-tetrahydroxycalix[4]arene following the literature procedure (Bitter *et al.*, 1995). Colourless prisms of the solvated calixarene suitable for X-ray diffraction were obtained by recrystallization from dichloromethane (m.p. 515–517 K).

### Refinement

The H atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.95  $\text{\AA}$ , and  $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5$  times  $U_{\text{eq}}$  (parent atom).

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
