Key indicators: single-crystal X-ray study; $T = 150\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.096; wR factor = 0.212; data-to-parameter ratio = 13.8.

The X-ray crystallographic study of the title compound, $C_{37}H_{41}N_3O_6$, at 150 K establishes the *N*-oxide form of the triazene 1-oxide unit. There is one intramolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen-bonding interaction and the crystal packing is stabilized by one $\text{N}-\text{H}\cdots\text{O}$, three $\text{C}-\text{H}\cdots\text{O}$ and three $\text{C}-\text{H}\cdots\pi$ intermolecular interactions. The dihedral angles between pairs of adjacent benzene rings are 14.9 (3), 56.3 (1) and 56.0 (1) $^\circ$.

1-Phenyl-3-{4-[4-(4-undecyloxybenzoyloxy)phenyloxycarbonyl]phenyl}triazene 1-oxide

P. Das, A. N. Biswas, S. Upreti, P. K. Mandal and P. Bandyopadhyay

Comment

Triazene-1-oxides are well known for their chelating ability (Ciunik *et al.*, 2002 & Hörner *et al.*, 2002), antitumour activity (Wilman, 1988) and also for initiating radical polymerization (Rapta *et al.*, 1996). In this communication the molecular structure of a triazene-1-oxide derivative has been reported. The molecular structure of the title compound, (**I**), has been shown in Figure 1, with the atom-numbering scheme. The planar phenyl moiety and trigonal planar geometry of the triazene N3 atom strongly suggest a resonance interaction extending over the C6, N1, N2 and N3 atoms. The N1—N2 and N2—N3 distances are in good agreement with the reported values of other triazene-1-oxides (Samanta *et al.*, 1997; Vaughan *et al.*, 1992). The shorter length of N1—N2 indicates its double-bond character and the longer N2—N3 distance is still shorter than a pure single-bond. The deviation of O1 from the molecular plane causes conjugation between N1—C6 to be less effective and is reflected in the longer N1—C6 than N3—C7 distance. There is an intramolecular N—H···O interaction within the triazene-1-oxide moiety (Figure 1, Table 1). The intramolecular hydrogen bondings result almost planar conformation of the triazene fragment of the molecule. The molecular packing of (**I**) has been shown in Figure 2. The intermolecular hydrogen bonding causes dimer formation of (**I**) (Figure 3). The crystal packing is stabilized by intermolecular one N—H···O (Figure 3, Table 1), three C—H···O (Figure 3, Figure 4, Table 1) and three C—H···π (Figure 5, Table 1) interactions (Das *et al.*, 2005). The intermolecular hydrogen bonding and intermolecular C—H···π interactions makes the phenyltriazene-1-oxide fragments of (**I**) in layer arrangement (Figure 2) in the molecular assembly.

Experimental

The title compound has been synthesized from nitobenzene, *p*-aminobenzoic acid, hydroquinone, *p*-hydroxybenzoic acid and *n*-bromoundecane using standard coupling processes involving multiple steps. The final product was crystallized by slow diffusion of ethanol into the dichloromethane solution of the title compound to yield crystals suitable for *x*-ray crystallography.

Refinement

The N-bound H atom was located in a difference Fourier map and its coordinates and isotropic displacement parameter were freely refined. C-bound H atoms were included at calculated positions as riding atoms with C—H set to 0.95 Å for (aromatic), 0.98 Å for (CH₃) and 0.99 Å for (CH₂) H atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ (1.5 U_{eq} for methyl group). Some low-angle reflections were excluded from the refinement, as they were probably obscured by the beam stop.

Figures

Fig. 1. The asymmetric unit of (**I**), with displacement ellipsoids drawn at the 75% probability level. Dotted lines indicate the intramolecular N—H···O interaction.

supplementary materials

Fig. 2. The molecular packing of (**I**) showing the arrangements of the molecules in the *bc*-plane.

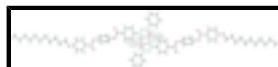

Fig. 3. Dimerization of two molecules (**I**) through intermolecular N—H···O and C—H···O hydrogen bonding interactions shown by dotted lines (Symmetry code: (i) $-x + 1, -y, -z + 2$).

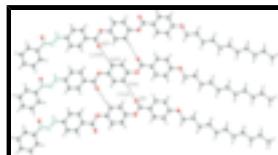

Fig. 4. Parallel arrangement of (**I**) through intermolecular C—H···O interactions shown by dotted lines (Symmetry codes: (ii) $x + 1, y, z$; (iii) $x - 1, y, z$).

Fig. 5. Parallel arrangement of (**I**) through intermolecular C—H··· π interactions shown by dotted lines (Symmetry codes: (iv) $x - 1, y + 1, z$; (v) $x, y - 1, z$. $Cg1$ and $Cg3$ are the centroids of the C1—C6 and C14—C19 rings, respectively).

Data collection

Bruker SMART APEX CCD area detector diffractometer	5812 independent reflections
Radiation source: fine-focus sealed tube	3464 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.072$
$T = 150(2) \text{ K}$	$\theta_{\max} = 25.5^\circ$
φ and ω scans	$\theta_{\min} = 1.7^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -6 \rightarrow 6$
$T_{\min} = 0.988, T_{\max} = 0.995$	$k = -14 \rightarrow 14$
11715 measured reflections	$l = -29 \rightarrow 30$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
---------------------	--

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.096$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.212$	$w = 1/[\sigma^2(F_o^2) + (0.082P)^2 + 0.0843P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.08$	$(\Delta/\sigma)_{\max} < 0.001$
5812 reflections	$\Delta\rho_{\max} = 0.31 \text{ e \AA}^{-3}$
420 parameters	$\Delta\rho_{\min} = -0.31 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
