Received 1 March 2008; accepted 1 March 2008

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.002$ Å; R factor = 0.051; wR factor = 0.146; data-to-parameter ratio = 22.2.

In the title compound, $C_{13}H_9N_5O_7$, one of the nitro groups is twisted away from the attached benzene ring by $16.21(8)^\circ$. The dihedral angle between the two benzene rings is $4.63(1)^\circ$. The molecular structure is stabilized by intramolecular N—H···O and O—H···N hydrogen bonds which generate an $S(6)$ ring motif. The molecules pack as layers parallel to the ab plane; molecules of adjacent layers are linked into chains along the [101] direction through N—H···O hydrogen bonds.

2-Hydroxy-5-nitrobenzaldehyde 2,4-dinitrophenylhydrazone

A. A. Tameem, B. Saad, A. M. Salhin, S. R. Jebas and H.-K. Fun

Comment

Phenylhydrazone derivatives have been synthesized in order to investigate their structures and analytical applications. 2,4-Dinitrophenylhydrazones play an important role as stabilizers for the detection, characterization and protection of the carbonyl group of compounds than phenylhydrazones (Niknam *et al.*, 2005). 2,4-Dinitrophenylhydrazone derivatives are widely used in various forms of analytical chemistry (Lamberton *et al.*, 1974; Zegota, 1999; Cordis *et al.*, 1998; Zlotorzynska & Lai, 1999) and are also used as dyes (Guillaumont & Nakamura, 2000). They are also found to have versatile co-ordinating abilities towards different metal ions (Raj *et al.*, 2006). In addition, they are used to determine airborne aldehydes and ketones (Vogel *et al.*, 2000) and as detectors of formaldehyde (Hanoune *et al.*, 2006). These compounds can exist as E and Z stereoisomers (Uchiyama *et al.*, 2003). Their existence as a keto tautomer in the solid state with an E configuration across the C—N bond have been reported (Fun *et al.*, 1996). The title compound, whose structure is reported here, is one of the series of phenylhydrazone derivatives that we have prepared; the crystal structures of some of these compounds have been studied previously (Tameem *et al.*, 2007; Salhin *et al.*, 2007).

The bond lengths and angles in the title compound (Fig.1) have normal values. The molecule is nearly planar, with a maximum deviation from the mean plane of 0.487 (1) Å for atom O1. The dihedral angle between the two benzene rings is 4.63 (1)°. The C—N bond lengths in the hydrazone moiety agree well with those reported earlier (Shan, Xu *et al.*, 2003; Shan, Yu *et al.*, 2003). The asymmetry of the exocyclic angles at C7 [C7—C8—C13 = 118.2 (2)° and C7—C8—C9 = 123.3 (2)°] is more pronounced than that at C6 [N1—C6—C1 = 122.7 (1)° and N1—C6—C5 = 120.5 (1)°]. One of the hydrazone N atoms is involved in an O—H···N intramolecular hydrogen bond with the hydroxy group, while the other is involved in an N—H···O intramolecular hydrogen bond with the nitro group. Each of these hydrogen bonds generate an S(6) ring motif (Bernstein *et al.*, 1995).

The molecules are linked into a chain along the [1 0 1] direction through N—H—O hydrogen bonds. The molecules pack as layers parallel to the *ab* plane. Within the layer, weak π—π interactions are observed between the C1—C6 and C8—C13 benzene rings, with a centroid-centroid distance of 3.7457 (8) Å.

Experimental

2,4-Dinitrophenylhydrazine (400 mg, 2 mmol) in concentrated sulfuric acid (5 ml) was slowly added to a solution of 2-hydroxy-5-nitrobenzaldehyde (337 mg, 2 mmol) in ethanol (95%, 20 ml). The mixture was stirred for 15 min, and was left to stand at room temperature for 30 min. The resulting product was filtered and washed with 95% ethanol (20 ml) and the orange powder product was collected. Crystals suitable for X-ray diffraction analysis were grown by slow evaporation of a saturated solution of the resulted compound in ethanol.

supplementary materials

Refinement

O- and N-bound H atoms were located in a difference map and refined isotropically. The remaining H atoms were placed in calculated positions (C—H = 0.93 Å) and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Special details

Geometry. Experimental. The low-temperature data was collected with the Oxford Cryosystem Cobra low-temperature attachment.

All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
