Received 4 April 2008; accepted 15 April 2008

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(C-C) = 0.007$ Å;
R factor = 0.058; wR factor = 0.124; data-to-parameter ratio = 14.1.

In the title compound, $[Zn_2(C_{14}H_8O_5)_2(C_{12}H_{12}N_2)_2] \cdot 2H_2O$, the Zn^{II} atom exhibits a distorted octahedral coordination geometry, defined by two N atoms from one 4,4'-dimethyl-2,2'-bipyridine ligand and four O atoms from two bridging 2,2'-oxydibenzoate ligands. The molecule is a centrosymmetric dimer. $\pi-\pi$ Stacking interactions are observed between the 4,4'-dimethyl-2,2'-bipyridine ligands, with a centroid–centroid distance of 3.649 (2) Å.

Comment

As part of our ongoing studies (Zhang *et al.*, 2008), we synthesized the title compound and report here its crystal structure.

The bond lengths and angles of the title compound are within normal ranges (Allen *et al.*, 1987) (Table 1). Intermolecular hydrogen bonds are formed between the water molecule and the carboxylate groups (Fig. 1; Table 2). The molecule is centrosymmetric with an inversion center located at the midpoint of the Zn^{II} and Zn^{II}ⁱ atoms [symmetry code (i): 1 - x , 2 - y , 1 - z]. The asymmetric unit thus contains one-half molecule. The Zn^{II} atom exhibits a distorted octahedral coordination geometry, defined by two N atoms from one 4,4'-dimethyl-2,2'-bipyridine (dbpy) ligand and four O atoms from two 2,2'-oxydibenzoate (odb) ligands. The two carboxylate groups of each odb ligand coordinate to two different Zn atoms.

The π - π stacking interactions between the aromatic rings of the dbpy ligands are observed, with a centroid–centroid distance of 3.649 (2) \AA [Fig. 2; $Cg1$ = the centroid of N1ⁱⁱ, C15ⁱⁱ, C16ⁱⁱ, C17ⁱⁱ, C19ⁱⁱ, C20ⁱⁱ and $Cg2$ = the centroid of N2, C21, C22, C23, C25, C26; symmetry code: (ii) 2 - x , 2 - y , 1 - z].

Experimental

The title compound was synthesized hydrothermally in a Teflon-lined autoclave (23 ml) by heating a mixture of H₂odb (0.052 g, 0.2 mmol), dbpy (0.037 g, 0.2 mmol), Zn(NO₃)₂.6H₂O (0.059 g, 0.2 mmol) and one drop of Et₃N (pH = 8~9) in water (10 ml) at 393 K for 3 d. Colorless single crystals were collected in 56% yield based on Zn.

Refinement

H atoms on C atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 (aromatic) and 0.96 (methyl) \AA and with $U_{\text{iso}}(\text{H}) = 1.2(1.5 \text{ for methyl groups})U_{\text{eq}}(\text{C})$. The H atoms of the water molecule were located from a difference Fourier map and fixed in the final refinements with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$.

Figures

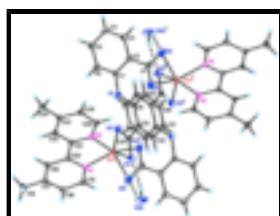

Fig. 1. The molecular structure of the title compound. Displacement ellipsoids are drawn at the 20% probability level. Hydrogen bonds are indicated by dashed lines. [Symmetry code (i): 1 - x , 2 - y , 1 - z .]

methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
