Received 29 March 2008; accepted 1 April 2008

 Key indicators: single-crystal X-ray study; $T = 125$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.039; wR factor = 0.113; data-to-parameter ratio = 13.9.

In the title compound, $\text{C}_{15}\text{H}_{20}\text{ClNO}_3$, the seven-membered ring adopts a distorted boat–sofa conformation; the methylene C atoms of this ring are coplanar with the benzene ring. Both methoxy groups are almost coplanar with the attached benzene ring [$\text{C}-\text{C}-\text{O}-\text{C} = 6.5$ (2) and -13.5 (3) $^\circ$]. An intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bond is observed in the molecular structure. In the crystal structure, a $\text{C}-\text{H}\cdots\pi$ interaction involving the benzene ring is observed.

3-(3-Chloropropyl)-7,8-dimethoxy-2,3,4,5-tetrahydro-1*H*-3-benzazepin-2-one at 125 K

X.-W. Cheng

Comment

Benzazepine derivatives have been of considerable medicinal interest, partly because the skeleton is a component of amaryllidaceae alkaloids such as galanthamine as well as of ribasine alkaloids represented by ribasine (Ishihara *et al.*, 1994). Many benzazepine derivatives have been reported to possess interesting biological activities. The title compound is an important intermediate of ivabradine, which was listed in market in 2006 as the representative of a novel pharmacological class termed specific bradycardic agents. Here the crystal structure of the title compound is reported.

In the title molecule (Fig.1), the seven-membered ring adopts a distorted boat-sofa conformation with a pseudo mirror plane through C7 and the centre of the N1—C10 bond. Atoms C9, C12 and C13 of the seven-membered ring are coplanar with the benzene ring. The dihedral angle between the C3-C9/C12/C13 and C9/C10/N1/C12 planes is 60.61 (8)°. The chloropropyl substituent group is in a (-)-synclinal conformation, as evidenced by the torsion angle N1—C14—C15—C16 of -68.9 (2)°, similar to that in a related structure (-62.63 (2)°, Reiffen *et al.*, 1990). The methoxy groups are almost coplanar with the benzene ring [C8—C3—O1—C1 = 6.5 (2)° and C5—C4—O2—C2 = -13.5 (3)°].

An intramolecular C—H...O hydrogen bond is observed in the molecular structure (Fig.1). In the crystal structure, a C—H... π interaction involving the benzene ring is observed (Table 1).

Experimental

The title compound was prepared according to the literature method (Reiffen *et al.*, 1981). Crystals suitable for X-ray analysis were obtained by slow evaporation of an isopropanol solution at 295 K.

Refinement

H atoms were positioned geometrically (C-H = 0.93-0.97 Å) and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2-1.5U_{\text{eq}}(\text{C})$.

Figures

Fig. 1. Molecular structure of the title compound, showing 30% probability displacement ellipsoids and the atomic numbering.

Fig. 2. Crystal packing of the title compound, viewed approximately down the *b* axis. Dashed lines indicate intramolecular hydrogen bonds.

6809 measured reflections	$l = -13 \rightarrow 11$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.039$	H-atom parameters constrained
$wR(F^2) = 0.112$	$w = 1/[\sigma^2(F_o^2) + (0.0588P)^2 + 0.1232P]$
$S = 1.06$	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} = 0.001$

2542 reflections $\Delta\rho_{\max} = 0.19 \text{ e } \text{\AA}^{-3}$
 183 parameters $\Delta\rho_{\min} = -0.23 \text{ e } \text{\AA}^{-3}$
 Primary atom site location: structure-invariant direct methods
 Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
