Received 13 March 2008; accepted 4 April 2008

Key indicators: single-crystal X-ray study; $T = 120 \text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$; R factor = 0.030; wR factor = 0.082; data-to-parameter ratio = 11.7.

The title compound, $C_{13}H_{13}N_5O$, consists of discrete molecules connected by $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds to form infinite chains, with $\text{N}\cdots\text{N}$ separations of 3.0379 (15) and 2.8853 (15) \AA . The benzene and purine ring systems make a dihedral angle of 77.58 (3) $^\circ$. The crystal structure is further stabilized by intramolecular $\text{N}\cdots\text{O}$ interactions [2.9541 (12) \AA] and intermolecular $\text{C}-\text{H}\cdots\text{C}$ and $\text{C}\cdots\text{C}$ contacts [3.304 (2), 3.368 (2), 3.667 (2), 3.618 (2) and 3.512 (2) \AA] which arrange the molecules into graphite-like layers. The interlayer separations are 3.248 and 3.256 \AA .

6-(2-Methoxybenzylamino)purine

Z. Trávníček, M. Matiková-Malarová and J. Mikulík

Comment

The structure of the title molecule, (I), extends our crystallographic knowledge regarding aromatic cytokinins and cyclin dependent kinase inhibitors derived from 6-benzylaminopurine.

The molecular structure of (I) is shown in Fig. 1. The molecule contains three different aromatic rings: benzene (A), pyrimidine (B) and imidazole (C). Each ring is essentially planar with the maximum deviations from the least-squares planes being 0.0169 (12) Å for C11 (ring A), 0.0147 (12) Å for C6 (ring B), and 0.0054 (13) Å for C8 (ring C). The dihedral angle between benzene ring (A) and purine skeleton (rings B and C) is 77.58 (3)°, whilst the pyrimidine (B) and imidazole (C) rings are almost coplanar, making a dihedral angle of 3.84 (4)° (Brandenburg, 2006). The interatomic parameters of (I) are comparable to those found for compounds bearing an electroneutral N9—H 6-benzylaminopurine moiety, *e.g.* 6-(2-chlorobenzylamino)purine dihydrate (Maloň *et al.*, 2001), 6-(2-bromobenzylamino)purine (Trávníček & Rosenker, 2006) and 6-(2-chloro-4-fluorobenzylamino)purine (Trávníček *et al.*, 2006). To date, 59 structures of compounds involving the 6-benzylaminopurine skeleton have been deposited in the CSD (Cambridge Structural Database, Version 5.29; Allen, 2002).

The secondary structure of (I) is stabilized by intermolecular hydrogen bonds of the N—H···N type (Table 1, Fig. 2), which connect the molecules into infinite one-dimensional chains. Moreover, intramolecular N···O interactions [N6···O1 = 2.9541 (12) Å, Fig. 2], and non-bonding intermolecular interactions of the type C···C [C2···C5ⁱⁱⁱ = 3.304 (2) Å, C2···C6ⁱⁱⁱ = 3.368 (2) Å] and C—H···C [C16···C14^{iv} = 3.667 (2), C16···C15^v = 3.618 (2), and C12···C6^{iv} = 3.512 (2) Å; symmetry codes: (iii) 1 - *x*, 2 - *y*, 1-*z*; (iv) 1 - *x*, 1 - *y*, 2-*z*; (v) -*x*, 1 - *y*, 2 - *z*] also contribute to the stabilization of the crystal structure (Fig. 3). The later non-bonding interactions arrange the molecules into *graphite-like* layers (Fig. 4). The separations between two layers formed by purine moieties are not equal, with the shortest distances being 3.248 and 3.256 Å. For comparison, the corresponding layer-to-layer separation has been found to be 3.352 Å (Space group *P*6₃/mmc, ICSD No. 52230), and 3.395 Å (Space group *P*6₃mc, ICSD No. 31170) in the crystal structure of graphite, as deposited in the ICSD (The Inorganic Crystal Structure Database, Version 1.4.2, 2007–2 and calculated using DIAMOND (Brandenburg, 2006).

Experimental

The title compound, was synthesized by a recently described method (Trávníček & Rosenker, 2006). The obtained micro-crystalline product was recrystallized from hot *N,N*-dimethylformamide. Well shaped colourless single crystals, suitable for X-ray structural analysis, were formed after slow evaporation of the solvent over a period of few days. The crystals were filtered off, washed with EtOH and Et₂O and dried in air.

supplementary materials

Refinement

All H atoms were located in difference maps and refined using a riding model, with C—H distances fixed to 0.95 (CH) or 0.98 (CH₃) Å, N—H distances to 0.88 Å, and with $U_{\text{iso}}(\text{H})$ values of 1.2 $U_{\text{eq}}(\text{CH}, \text{N})$ or 1.5 $U_{\text{eq}}(\text{CH}_3)$. The highest unassigned difference Fourier peak, 0.198 e·Å⁻³, is located at 0.24 Å from atom H16A.

Figures

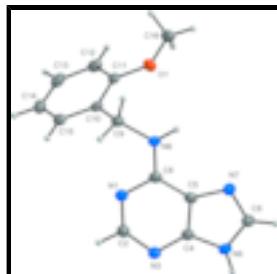

Fig. 1. The molecular structure of (I). Non-H atoms are drawn with 50% probability displacement ellipsoids.

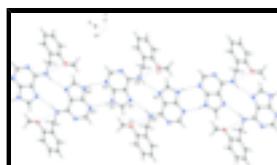

Fig. 2. Part of the crystal structure of (I), showing the formation of infinite chains, N—H···N hydrogen bonds [N6···N7ⁱ = 3.0379 (15) Å, N9···N3ⁱⁱ = 2.8853 (15) Å] and O···N non-bonding contacts [N6···O1 = 2.9541 (12) Å] (dashed lines). Symmetry codes: (i) 1 - x , 1 - y , - z + 1; (ii) 2 - x , 2 - y , - z + 1.

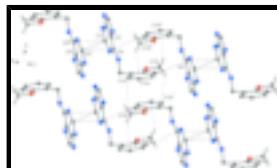

Fig. 3. Part of the crystal structure of (I), showing the C···C and C—H···C interactions (dashed lines) connecting molecules among layers. H-atoms not involved into hydrogen bonding have been omitted for clarity. Symmetry codes: (iii) 1 - x , 2 - y , 1 - z ; (iv) 1 - x , 1 - y , 2 - z ; (v) - x , 1 - y , 2 - z .

Fig. 4. Part of the crystal structure of (I), showing the formation of *graphite-like* layers. Dashed lines represent the shortest distances between two neighbouring layers formed by purine moieties ($d_1 = 3.256$, $d_2 = 3.248$ Å). H-atoms have been omitted for clarity.
