Received 20 February 2008; accepted 4 March 2008

Key indicators: single-crystal X-ray study; $T = 123\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.051; wR factor = 0.106; data-to-parameter ratio = 16.1.

The title compound, $\text{C}_{15}\text{H}_{12}\text{O}_3$, was obtained unintentionally as the by-product of an attempted recrystallization from methanol of propantheline bromide, an antimuscarinic drug. The xanthone unit is folded, with a dihedral angle of $24.81(9)^\circ$ between the benzene rings. The ester substituent adopts a *trans* staggered conformation, with a $\text{C}-\text{C}-\text{O}-\text{C}$ torsion angle of $178.4(1)^\circ$. The molecules pack in distinct layers, facilitated by $\text{C}-\text{H}\cdots\pi$ and weak $\pi-\pi$ ring interactions. A weak $\text{C}-\text{H}\cdots\text{O}$ interaction also occurs; however, no classical hydrogen bonding is observed.

Methyl 9*H*-xanthene-9-carboxylate

P. M. Dean, J. Turanjanin and D. R. MacFarlane

Comment

It was found that propantheline bromide (George *et al.*, 2007) undergoes facile transesterification by methanol to produce the by-product 9*H*-xanthene-9-carboxylic acid methyl ester (Avdovich *et al.*, 1986). Surprisingly, the structural elucidation of this analogue (Fig. 1) has not been reported in the literature until now. Now the structural determination and analysis is briefly described.

The xanthone unit is bent, with the aromatic planes oriented to each other by an interplanar angle of 24.81 (9) $^{\circ}$. The ester substituent adopts a *trans* staggered conformation with a C7—C14—O3—C15 torsion angle of 178.4 (1) $^{\circ}$. Additionally, as is typical of an ester, the O3—C14 distance is 1.326 (2) Å and the O3—C15 distance is 1.448 (2) Å, indicating the sp^2 hybridization of C14.

The overall packing is shown in Fig. 2. Molecules are related by centres of symmetry, resulting in a head-to-head arrangement, that packs in aromatic and non-aromatic layers lying parallel to the (100) plane. Fig. 2 displays the orientation of the molecules, facilitating the weak C—H \cdots O hydrogen bonding between the methyl and carbonyl groups (distance: C15—H15C \cdots O2ⁱ ($i = x, y - 1, z$) 3.407 (2) Å - see Table 1) and the C—H \cdots π and weak $\pi\cdots\pi$ ring interactions (Table 2). A short range contact, 2.683 (2) Å, also occurs between the aromatic C4—H4 and the carbonyl oxygen O2 (distance: C4—H4 \cdots O2ⁱⁱ ($ii = x, 1 - y, -1/2 + z$)).

Experimental

The title compound was obtained unintentionally as the product of an attempted recrystallization of propantheline bromide (50 mg) in methanol (2 ml) at room temperature. Crystals resulted after 6 days; these were coated with Paratone N oil (Exxon Chemical Co., TX, USA) immediately after isolation and cooled in a stream of nitrogen vapour on the diffractometer. Melting point: 360.7 K.

Refinement

All H atoms were observed in difference syntheses and were then placed in geometrically idealized positions and constrained to ride on their parent atoms with C—H distances in the range 0.95–1.00 Å. $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$, where $x = 1.5$ for methyl and 1.2 for all other C atoms.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.050$	H-atom parameters constrained
$wR(F^2) = 0.106$	$w = 1/[\sigma^2(F_o^2) + (0.0212P)^2 + 2.7981P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\max} < 0.001$
2672 reflections	$\Delta\rho_{\max} = 0.20 \text{ e \AA}^{-3}$
166 parameters	$\Delta\rho_{\min} = -0.21 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

$D\cdots H$	$H\cdots A$	$D\cdots A$	$D\cdots H\cdots A$
C15—H15C \cdots O2 ⁱ	0.98	2.53	3.407 (3)
C3—H3 \cdots Cg2 ⁱⁱ	0.95	2.95	3.668 (2)
C11—H11 \cdots Cg1 ⁱⁱⁱ	0.95	3.18	3.825 (2)
C15—H15B \cdots Cg1 ^{iv}	0.98	3.06	3.432 (2)
C15—H15C \cdots Cg1 ^{iv}	0.98	3.11	3.432 (2)

Symmetry codes: (i) $x, y-1, z$; (ii) $x, -y, z-1/2$; (iii) $-x+1/2, -y+1/2, -z+1$; (iv) $-x+1, -y, -z+1$.

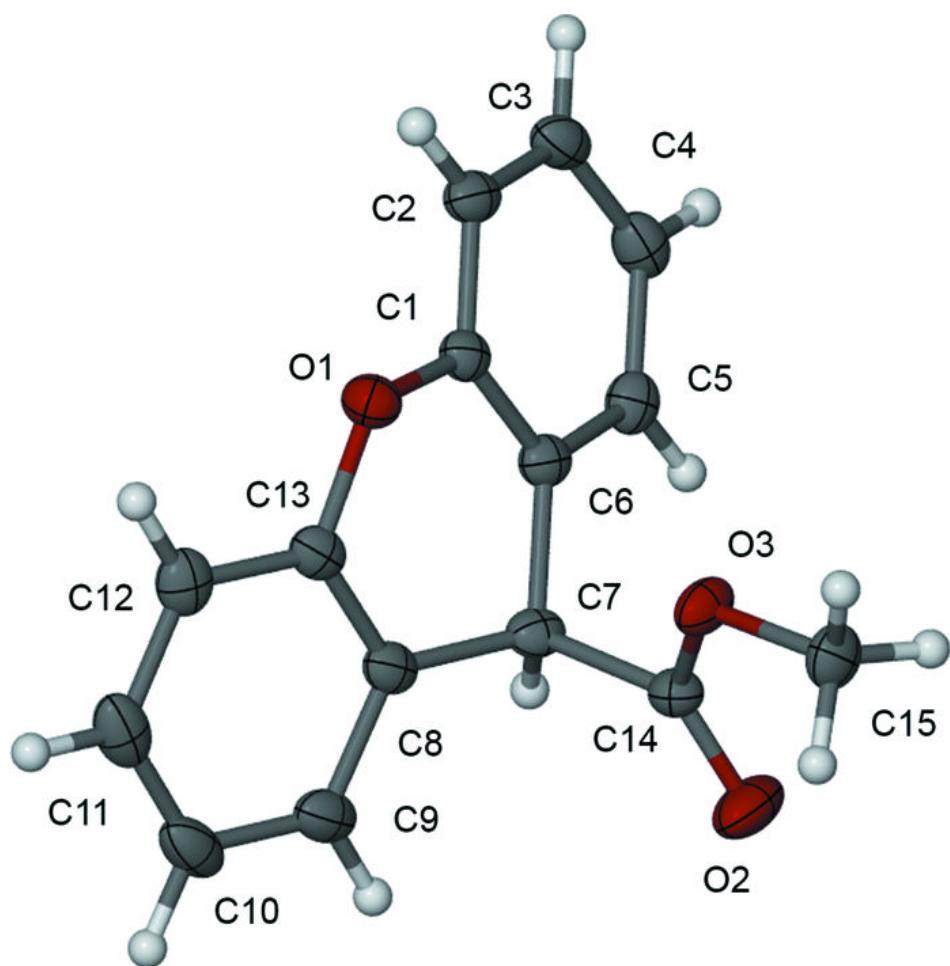

Table 2

Geometrical parameters (\AA , $^\circ$) of the inter-ring π — π interactions. α is the dihedral angle between planes I and J, CgI is the centroid of plane I and CgJ the centroid of plane J.

CgI	CgJ	Cg \cdots Cg	α	Symmetry position of CgJ
Cg1	Cg2	5.590 (1)	59.44	$x, 1-y, -1/2+z$
Cg1	Cg2	4.944 (1)	24.81	$1/2-x, 1/2-y, 1-z$
Cg2	Cg1	4.863 (1)	59.44	$x, -y, 1/2+z$
Cg2	Cg2	3.684 (1)	0.03	$1/2-x, 1/2-y, 1-z$

Notes: Cg1 is the centroid of ring C1/C6; Cg2 is the centroid of ring C8/C13.
