

## (S)-2-Methylpiperazinium dichloride 0.42-hydrate

**William T. A. Harrison**

Department of Chemistry, University of Aberdeen, Meston Walk, Aberdeen AB24 3UE, Scotland

Correspondence e-mail: w.harrison@abdn.ac.uk

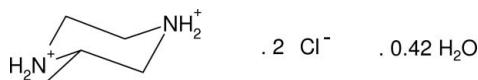

Received 27 February 2008; accepted 16 April 2008

Key indicators: single-crystal X-ray study;  $T = 120\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ; H-atom completeness 95%; disorder in solvent or counterion;  $R$  factor = 0.043;  $wR$  factor = 0.110; data-to-parameter ratio = 21.5.

The cations and anions of the chiral title compound,  $\text{C}_5\text{H}_{14}\text{N}_2^{2+}\cdot 2\text{Cl}^- \cdot 0.42\text{H}_2\text{O}$ , are linked by  $\text{N}-\text{H}\cdots\text{Cl}$  hydrogen bonds into chains propagating in [100], which contain  $R_4^2(14)$  loops.

### Related literature

### (S)-2-Methylpiperazinium dichloride 0.42-hydrate

**W. T. A. Harrison**

#### Comment

The title compound, (I), is a chiral molecular salt, in which the organic species has accepted two protons from the hydrochloric acid. The geometrical parameters of the  $C_5H_{14}N_2^{2+}$  dication (Fig. 1) are similar to those of the same species in other structures (Muller *et al.*, 2005; Tuel *et al.*, 2002) and its six-membered ring is a typical chair. The C4 stereogenic centre has S configuration and the pendant C5 methyl group occupies an equatorial position with respect to the ring.

In the crystal of (I), the cations and anions are linked by N—H $\cdots$ Cl hydrogen bonds (Table 1) into chains propagating in [100], with two chloride ions bridging each dication, as shown in Fig 2. In terms of graph theory (Bernstein *et al.*, 1995),  $R_4^2(14)$  loops arise from this connectivity.

The O1 water molecule is partially occupied in the crystal of (I), although there is no obvious crystallographic reason (*e.g.* symmetry generated close contacts) as to why this should be the case. Based on short O $\cdots$ Cl contacts of less than 3.5 Å, the water molecule probably participates in O—H $\cdots$ Cl hydrogen bonds thereby helping to crosslink the [100] chains, but the water H atoms could not be found or placed unambiguously in the present study.

#### Experimental

Equimolar quantities of 0.1 M aqueous (S)-2-methylpiperazine and 0.1 M aqueous hydrochloric acid were mixed, leading to a clear solution. Colourless plates of (I) grew as the water slowly evaporated.

#### Refinement

When refined with full occupancy, atom O1 showed an excessively large  $U_{\text{iso}}$  value of 0.15 Å<sup>2</sup>. Its fractional site occupancy was refined and rapidly converged to 0.420 (11) with a more reasonable  $U_{\text{iso}}$  value and improvement in fit. Its  $U^{ij}$  values were subsequently refined and converged without difficulty. Its presumed attached H atoms could not be located from difference maps in the present study. Attempts at geometrical placement were ambiguous, as there are several possible O $\cdots$ Cl contacts that might correspond to O—H $\cdots$ Cl hydrogen bonds.

The other hydrogen atoms were geometrically placed (C—H = 0.95–0.99 Å, N—H = 0.92 Å) and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$  or  $1.5U_{\text{eq}}(\text{methyl C})$ . The methyl group was allowed to rotate, but not tip, to best fit the electron density.

The highest difference peak is 0.73 Å from H1.

$k = -14 \rightarrow 15$

5193 measured reflections

$l = -8 \rightarrow 9$

1999 independent reflections

### Refinement

Refinement on  $F^2$

Hydrogen site location: inferred from neighbouring sites

Least-squares matrix: full

H-atom parameters constrained

$R[F^2 > 2\sigma(F^2)] = 0.042$	$w = 1/[\sigma^2(F_o^2) + (0.0558P)^2 + 0.1729P]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.110$	$(\Delta/\sigma)_{\max} < 0.001$
$S = 1.06$	$\Delta\rho_{\max} = 0.93 \text{ e \AA}^{-3}$
1999 reflections	$\Delta\rho_{\min} = -0.22 \text{ e \AA}^{-3}$
93 parameters	Extinction correction: none
1 restraint	Absolute structure: Flack (1983), 929 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.04 (9)
Secondary atom site location: difference Fourier map	

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
