Received 2 April 2008; accepted 21 May 2008

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{Mo}–\text{O}) = 0.001$  Å; disorder in main residue;  $R$  factor = 0.027;  $wR$  factor = 0.086; data-to-parameter ratio = 22.2.

Praseodymium calcium dimolybdenum heptaoxide,  $\text{Pr}_{1.37}\text{Ca}_{0.63}\text{Mo}_2\text{O}_7$ , crystallizes in the cubic pyrochlore-type structure. In the crystal structure,  $\text{MoO}_6$  octahedra are linked together by common corners, forming a three-dimensional  $[\text{Mo}_2\text{O}_6]$  network. The Pr and Ca atoms and the remaining O atoms are located in the voids of the  $[\text{Mo}_2\text{O}_6]$  network. The Pr and Ca atoms are distributed statistically over the same 16c crystallographic position with site-occupancy factors of 0.684 (3) and 0.316 (3), respectively. They are surrounded by eight O atoms forming a ditrigonal scalenohedron. All atoms lie on special positions. The (Pr, Ca) and Mo atoms are, respectively in the 16c and 16d positions with  $\bar{3}m$  symmetry, and the O atoms in the 48f or 8a positions with  $mm$  or  $\bar{4}3m$  site symmetry, respectively.

## The pyrochlore-type molybdate $\text{Pr}_{1.37}\text{Ca}_{0.63}\text{Mo}_2\text{O}_7$

**P. Gall and P. Gougeon**

### Comment

An attempt to synthesize  $\text{PrCaMo}_{16}\text{O}_{28}$ , a compound with the  $\text{PrMo}_8\text{O}_{14}$  type structure (Kerihuel & Gougeon, 1995), was unsuccessful, resulting in a multiphase product. However, the formation of the new compound,  $\text{Pr}_{1.37}\text{Ca}_{0.63}\text{Mo}_2\text{O}_7$  was achieved. A survey of the literature related to the rare earth molybdates  $R_2\text{Mo}_2\text{O}_7$  with the database SciFinder Scholar (American Chemical Society, 2007) shows that these compounds only form for the rare-earths from Nd to Lu. To our knowledge, no quaternary molybdate pyrochlore has thus far been reported.

### Experimental

Single crystals of  $\text{Pr}_{1.37}\text{Ca}_{0.63}\text{Mo}_2\text{O}_7$  were prepared from a mixture of  $\text{Pr}_6\text{O}_{11}$  (Rhone Poulenc, 99.99%),  $\text{CaMoO}_4$ ,  $\text{MoO}_3$  (Cerac, 99.95%) and Mo (Plansee, 99.9999%) with the nominal composition  $\text{PrCaMo}_{16}\text{O}_{28}$ . Before use, Mo powder was reduced under a flow of  $\text{H}_2$  gas at 1273 K for ten hours in order to eliminate any trace of oxygen.  $\text{CaMoO}_4$  was prepared by heating a stoichiometric mixture of  $\text{CaCO}_3$  and  $\text{MoO}_3$  in an open porcelain crucible at 1073 K for 24 h. The initial mixture (*ca* 5 g) was cold pressed and loaded into a molybdenum crucible, which was sealed under a low argon pressure using an arc welding system. The charge was heated at a rate of 300 K/h up to 2223 K, and the temperature was held for 5 min., then cooled at 100 K/h to 1373 K and finally furnace cooled. The final product was multiphasic with  $\text{Pr}_{1.37}\text{Ca}_{0.63}\text{Mo}_2\text{O}_7$  and  $\text{Pr}_{1-x}\text{Ca}_x\text{Mo}_{10}\text{O}_{16}$ , isomorphous with the  $\text{RMo}_5\text{O}_8$  compounds ( $R = \text{La to Gd}$ ; Gougeon *et al.*, 2003), as predominant phases. The crystals thus obtained were of irregular shape.

### Refinement

The structure was solved by direct methods using *SIR97* (Altomare *et al.*, 1999). The second setting, with the origin at  $\bar{3}$  m of the  $\text{Fd}3\text{m}$  space group, was chosen. Initial refinement with full occupancy for the  $\text{Pr}1$  site resulted in an *R* factor of about 0.30. Refinement of the site-occupancy factor of the  $\text{Pr}1$  atoms lowered the *R* factor to 0.0274 with an occupation factor of 0.74. As qualitative microanalyses using a Jeol JSM-35 CF scanning electron microscope equipped with a Tracor energy-dispersive-type X-ray spectrometer indicated the presence of calcium in the crystals, we surmised that the deficiency observed on the  $\text{Pr}1$  site resulted from the presence of calcium. Refinements taking into account an occupation of the deficient  $\text{Pr}1$  site simultaneously by Pr and Ca atoms with no constraint on the site-occupancy factors of the  $\text{Pr}1$  and  $\text{Ca}1$  atoms led to an over-occupation of the 16 d position. Consequently, the sum of the site occupancy factors was constrained to unity, and the ADPs of the  $\text{Pr}1$  and  $\text{Ca}1$  atoms were constrained to be equal. Refinement of the occupancy factor of the  $\text{O}2$  atom in 8a position which frequently exhibits partial or total deficiency, indicates full occupation of this position.

$b = 10.4329 (3) \text{ \AA}$	Cell parameters from 1172 reflections
$c = 10.4329 (3) \text{ \AA}$	$\theta = 3.4\text{--}45.3^\circ$
$\alpha = 90^\circ$	$\mu = 16.45 \text{ mm}^{-1}$
$\beta = 90^\circ$	$T = 293 (2) \text{ K}$
$\gamma = 90^\circ$	Irregular block, black
$V = 1135.57 (6) \text{ \AA}^3$	$0.16 \times 0.14 \times 0.12 \text{ mm}$

### Data collection

Nonius KappaCCD diffractometer	266 independent reflections
Radiation source: fine-focus sealed tube	167 reflections with $I > 2\sigma(I)$
Monochromator: horizontally mounted graphite crystal	$R_{\text{int}} = 0.053$
Detector resolution: 9 pixels $\text{mm}^{-1}$	$\theta_{\text{max}} = 45.3^\circ$
$T = 293(2) \text{ K}$	$\theta_{\text{min}} = 3.4^\circ$
$\varphi$ scans ( $\kappa = 0$ ) + additional $\omega$ scans	$h = 1\text{--}20$
Absorption correction: analytical (de Meulenaer & Tompa, 1965)	$k = 0\text{--}14$
$T_{\text{min}} = 0.093$ , $T_{\text{max}} = 0.125$	$l = 0\text{--}13$
771 measured reflections	

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	$w = 1/[\sigma^2(F_o^2) + (0.0207P)^2 + 4.885P]$
$R[F^2 > 2\sigma(F^2)] = 0.027$	where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.086$	$(\Delta/\sigma)_{\text{max}} < 0.001$
	$\Delta\rho_{\text{max}} = 2.51 \text{ e \AA}^{-3}$

$S = 1.12$	$\Delta\rho_{\min} = -1.55 \text{ e \AA}^{-3}$
266 reflections	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = k F_c [1 + 0.001 x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$
12 parameters	Extinction coefficient: 0.00256 (19)
Primary atom site location: structure-invariant direct methods	

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
