Received 23 April 2008; accepted 30 April 2008

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.017$ Å; R factor = 0.031; wR factor = 0.069; data-to-parameter ratio = 21.0.

The title compound, $[\text{WMoBr}(\text{C}_5\text{H}_5)(\text{CO})_3]$, is built up from a pseudo-square-pyramidal piano-stool coordination around the Mo atom, the important geometry being Mo—W = 2.6872 (7) Å, W—Br = 2.5591 (9) Å and Mo—W—Br = 158.35 (3)°.

Bromido-1 κ Br-tricarbonyl-2 κ^3 C-(2 η^5 -cyclopentadienyl)molybdenum(I)tungsten(I)(W—Mo)

M. O. Onani, J.-A. Gertenbach and M. D. Bala

Comment

The compound **I** was a by-product of a study on the functionalization of paraffins using transition metals. The functionalized compounds have potential applications in catalysis and organic syntheses (Changamu *et al.*, 2006). The compound **I** is similar to the reported structure of $(\eta^5\text{-C}_5\text{H}_5(\text{CO})_3\text{MoHgCl}$ (Bueno *et al.*, 1981), Albright *et al.* (1978). The bond distances of W—Mo, 2.6872 (7) Å and W—Br, 2.5591 (9) Å are comparable to Hg—Mo, 2.693 (30) Å and Hg—Cl, 2.437 (8) Å respectively. The slight difference between the bond lengths involving the halides could be attributed to the difference in electronegativity and hence basicity between bromine and chlorine. The coordination around Mo is a pseudo-square pyramidal piano stool arrangement. (Fig. 1)

Experimental

The compound **I** was prepared according to a reported procedure (Friedrich *et al.*, 2004) and crystals were grown by slow evaporation of a mixture of dichloromethane and hexane at 263 K.

Refinement

Hydrogen atoms were treated as riding on their parent C atoms with C—H = 0.95 Å and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

Figures

Fig. 1. Molecular structure of the title complex showing the atom numbering scheme. Ellipsoids are drawn at the 50% probability level.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.030$	$w = 1/[\sigma^2(F_o^2) + (0.0238P)^2]$
$wR(F^2) = 0.069$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.02$	$(\Delta/\sigma)_{\text{max}} = 0.001$
2673 reflections	$\Delta\rho_{\text{max}} = 1.31 \text{ e \AA}^{-3}$
127 parameters	$\Delta\rho_{\text{min}} = -0.72 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none
Secondary atom site location: difference Fourier map	Absolute structure: Flack (1983), 1118 Friedel pairs
	Flack parameter: 0.00 (1)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
