Received 5 April 2008; accepted 30 May 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.012$ Å; R factor = 0.076; wR factor = 0.181; data-to-parameter ratio = 18.3.

In the title mononuclear copper(II) complex, $[\text{Cu}(\text{C}_{10}\text{H}_{12}\text{BrN}_2\text{O})(\text{NCS})]$, the Cu^{II} ion is coordinated by two N atoms and one O atom from a Schiff base ligand, and by one N atom from a thiocyanate anion, giving a square-planar geometry. In the crystal structure, symmetry-related molecules are linked by an $\text{N}-\text{H}\cdots\text{S}$ hydrogen bond.

{4-Bromo-2-[2-(methylamino)ethyliminomethyl]phenolato}thiocyanatocopper(II)

J.-Y. Ma

Comment

Recently, we have reported on the crystal structure analyses of some metal complexes derived from Schiff base ligands (Ma, Lv *et al.*, 2006; Ma, Gu *et al.*, 2006; Ma, Wu *et al.*, 2006; Ma *et al.*, 2005). As part of a further investigation of the structures of such complexes, the title mononuclear copper(II) complex, (I), is reported on here.

In complex (I), the Cu atom is coordinated by two nitrogen atoms and one oxygen atom from a Schiff base ligand, and by one nitrogen atom from a thiocyanate anion, giving a square planar geometry (Fig. 1). All the bond lengths and angles related to the Cu atom in the complex are within normal ranges, and comparable to the values observed in other similar copper(II) complexes (Wei *et al.*, 2007; Diao *et al.*, 2007; Diao & Li, 2007). The four coordinating atoms around the Cu centre are approximately coplanar, giving a square-planar geometry with an average deviation of 0.090 (5) Å; the Cu atom lies 0.095 (2) Å above this plane. The C8—C9—N2—C10 torsion angle is 1.5 (3)°.

In the crystal structure of compound (I) symmetry related molecules are linked by an N—H···S hydrogen bond (Table 1).

Experimental

N-Methylethane-1,2-diamine (0.5 mmol, 37.0 mg) and 5-bromosalicylaldehyde (0.5 mmol, 100.5 mg) were dissolved in methanol (30 ml). The mixture was stirred for 1 h to obtain a clear yellow solution. To this solution was added with stirring a methanol solution (20 ml) of copper(II) acetate (0.5 mmol, 99.6 mg) and a methanol solution (10 ml) of ammonium thiocyanate (0.5 mmol, 38.0 mg). After keeping the resulting solution in air for a few days, blue block-shaped crystals were formed.

Refinement

All the H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms with C—H = 0.93 - 0.97 Å, with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{C})$. An unassigned maximum residual density (1.68 Å³) was observed 1.03 Å from Br1, which is due to the tail-effects of the heavy atom Br1. The structure contains solvent accessible voids of 119 Å³, which may perhaps accommodate a partially occupied solvent molecule.

Figures

Fig. 1. The molecular structure of compound (I), showing the atomic numbering scheme and the displacement ellipsoids drawn at the 30% probability level.

$Z = 4$	$0.32 \times 0.32 \times 0.31 \text{ mm}$

Data collection

Bruker SMART CCD area-detector diffractometer	2997 independent reflections
Radiation source: fine-focus sealed tube	1875 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.071$
$T = 298(2) \text{ K}$	$\theta_{\text{max}} = 26.5^\circ$
ω scan	$\theta_{\text{min}} = 2.6^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -7 \rightarrow 7$
$T_{\text{min}} = 0.259$, $T_{\text{max}} = 0.267$	$k = -24 \rightarrow 24$
11246 measured reflections	$l = -15 \rightarrow 15$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.076$	H-atom parameters constrained
$wR(F^2) = 0.181$	$w = 1/[\sigma^2(F_o^2) + (0.0672P)^2 + 4.7203P]$
$S = 1.11$	where $P = (F_o^2 + 2F_c^2)/3$
2997 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
164 parameters	$\Delta\rho_{\text{max}} = 1.68 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.84 \text{ e \AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
