Received 30 April 2008; accepted 2 June 2008

Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(\text{S}-\text{C}) = 0.004$ Å; R factor = 0.042; wR factor = 0.135; data-to-parameter ratio = 22.7.

In the title compound, $[\text{Cr}(\text{C}_2\text{H}_6\text{OS})_6]\text{Cl}_3$, each Cr^{III} ion is located on a three-fold inversion axis and is coordinated by six dimethylsulfoxide ligands [$\text{Cr}-\text{O} = 1.970(2)$ – $1.972(2)$ Å; $\text{O}-\text{Cr}-\text{O} = 88.19(9)$ and $91.81(9)^\circ$] in a slightly distorted octahedral geometry. The Cl^- anions take part in the formation of weak $\text{C}-\text{H}\cdots\text{Cl}$ hydrogen bonds, which contribute to the crystal packing stabilization.

Hexakis(dimethyl sulfoxide- κ O)chromium(III) trichloride

Y. M. Mikhaylichenko, M. Haukka, V. O. Pavlenko, I. O. Fritsky and T. S. Iskenderov

Comment

Dimethylsulfoxide (dmsO) has often been used as solvent and a ligand in inorganic chemistry since the beginning of the 1960th. Dimethylsulfoxide is a monodentate O-,S-donor ligand (Reynolds, 1970). Solvates of some transition metal ions have been prepared and structurally characterized (Persson *et al.*, 1995 and references therein).

The title compound, (I), is composed of $[\text{Cr}(\text{C}_2\text{H}_6\text{OS})_6]^{3+}$ cations and chloride anions. The Cr(III) ion is located on a 3-fold inversion axis being coordinated by the six dimethylsulfoxide ligands in a slightly distorted octahedral geometry (Fig. 1), with Cr—O 1.970 (2)–1.972 (2) Å interatomic distances and O—Cr—O 88.19 (9), 91.81 (9)° bond angles. A search in the Cambridge Structural Database revealed 14 reports of compounds containing transition metal hexakis(dimethylsulfoxide) cations, of which two described the structure of the $[\text{Cr}(\text{C}_2\text{H}_6\text{OS})_6]^{3+}$ cation in $[\text{Cr}(\text{C}_2\text{H}_6\text{OS})_6](\text{ClO}_4)_3$ (Chan *et al.*, 2004) and $[\text{Cr}(\text{C}_2\text{H}_6\text{OS})_6](\text{NO}_3)_3$ (Ohrstrom & Svensson, 2000). The S=O bond lengths in the aforementioned compounds are almost identical, 1.542 (3) Å versus 1.543 (2) Å for the title compound, as well as the O—Cr—O angles, 87.9/92.2° versus 88.19–91.81°. In the present structure the average value of Cr—O—S angles (121.9°) is somewhat smaller than that in $[\text{Cr}(\text{C}_2\text{H}_6\text{OS})_6](\text{NO}_3)_3$ (123.6°). All other angles and bonds of the title compound are very similar to the above mentioned structures.

In (I), the Cl anions take part in formation of weak C—H...Cl hydrogen bonds (Table 1), which contribute to the crystal packing stabilization.

Experimental

Complex (I) was synthesized during the attempt to prepare chromium (III) complex with 1*H*-pyrazole-3,5-dicarbohydrazide (Fig. 2) by adding $\text{CrCl}_3 \cdot 6\text{H}_2\text{O}$ (0.3 mmol, 3 ml of 0.1 *M* aqueous solution) to the 1*H*-pyrazole-3,5-dicarbohydrazide (0.0552 g, 0.3 mmol) in dimethylsulfoxide solution (6 ml). The mixture was stirred for 30 min at ambient temperature. The resulting green solution was filtered and the filtrate was left to stand at room temperature. Slow evaporation of the solvent during 2 weeks yielded green crystals of (I).

Refinement

The H atoms were positioned geometrically (C—H 0.98 Å) and allowed to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$.

Figures

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.042$	H-atom parameters constrained
$wR(F^2) = 0.135$	$w = 1/[\sigma^2(F_o^2) + (0.0789P)^2 + 3.3338P]$
$S = 1.14$	where $P = (F_o^2 + 2F_c^2)/3$
1044 reflections	$(\Delta/\sigma)_{\max} < 0.001$
46 parameters	$\Delta\rho_{\max} = 0.82 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.48 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
