Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.002$  Å;  $R$  factor = 0.057;  $wR$  factor = 0.163; data-to-parameter ratio = 20.7.

The asymmetric unit of the title compound,  $C_{20}H_{16}N_2O_4 \cdot CH_3OH$ , contains two Schiff base zwitterions and two methanol solvent molecules. The dihedral angles between the central benzene ring and the two outer benzene rings of the Schiff base are 2.57 (7) and 52.30 (7)° in one molecule and 5.83 (7) and 49.82 (7)° in the other molecule. Intramolecular O—H···N and N—H···O hydrogen bonds generate  $S(6)$  ring motifs, whereas intramolecular N—H···N hydrogen bonds generate  $S(5)$  ring motifs. In the crystal structure, O—H···O, hydrogen bonds and weak C—H···O interactions link the molecules into one-dimensional chains along the  $b$ -axis direction and are further connected by O—H···O and weak C—H···O interactions into a three-dimensional network. C—H···π and π—π interactions [centroid–centroid distances = 3.6228 (9) and 3.6881 (9) Å] are also observed in the crystal structure.

## 2-((E)-{2-[(1E)-(2,4-Dihydroxybenzylidene)amino]phenyl}iminiomethyl)-5-hydroxyphenolate methanol solvate

N. E. Eltayeb, S. G. Teoh, S. Chantrapromma, H.-K. Fun and R. Adnan

### Comment

Schiff bases have received much attention because of their potential applications with some of these compounds exhibiting various pharmacological activities, as noted by their anticancer (Dao *et al.*, 2000), anti-HIV (Sriram *et al.*, 2006), antibacterial and antifungal (Karthikeyan *et al.*, 2006) properties. In addition, some of them may be used as analytical reagents for the determination of trace elements (Eltayeb & Ahmed, 2005*a,b*) such as nickel in some natural food products (Fakhari *et al.*, 2005). We reported the crystal structures of 5,5'-Dimethoxy-2,2'-[1,2-phenylenebis(nitrilomethylidyne)diphenol (Eltayeb *et al.*, 2007*a*) and 4,4'-Dimethoxy-2,2'-[1,2-phenylenebis(nitrilomethylidyne)diphenol (Eltayeb *et al.*, 2007*b*) and we report here the structure of the title compound (*I*), a closely-related Schiff base.

The asymmetric unit of (*I*) (Fig. 1) contains two Schiff base zwitterions and two methanol molecules (*A* and *B*). The zwitterion results from protonation of the imine N1A and N1B atoms with protons from the O2A and O2B hydroxy groups resulting in the formation of iminium and hydroxyphenolate groups. In the structure, the hydroxyphenolate ring (C1–C6/O1–O2) is nearly coplanar with the phenyl ring (C8–C13) as indicated by the dihedral angles between these two rings being 2.57 (7)° in molecule *A* and 5.83 (7)° in molecule *B* and the torsion angle C8/N1/C7/C6 = 179.33 (2)° in molecule *A* and 178.07 (12)° in molecule *B*. The C8–C13 phenyl ring makes a dihedral angle of 52.30 (7)° with the dihydroxyphenyl ring (C15–C20/O3–O4) in molecule *A* [49.82 (7)° in molecule *B*].

Intramolecular hydrogen bonds, O3A—H3OA···N2A, N1A—H1NA···O2A, O3B—H3OB···N2B and N1B—H1NB···O2B (Table 1) generate S(6) ring motifs whereas N1A—H1NA···N2A and N1B—H1NB···N2B generate S(5) ring motifs (Bernstein *et al.*, 1995). Bond lengths and angles are in normal ranges (Allen *et al.*, 1987) and comparable to those in related structures (Eltayeb *et al.*, 2007*a,b*). In the crystal packing (Fig. 2), O—H···O, hydrogen bonds and weak C—H···O interactions (Table 1) link the molecules into one dimensional chains along the *b* direction and are further connected by O—H···O and weak C—H···O interactions (Table 1) into a three-dimensional network (Table 1). The crystal is further stabilized by weak C—H···π interactions (Table 1). π···π interactions were also observed with the distances of *Cg*<sub>1</sub>···*Cg*<sub>5</sub> = 3.6228 (9) Å and *Cg*<sub>2</sub>···*Cg*<sub>4</sub> = 3.6881 (9) Å (symmetry code : *x, y, z* in each case); *Cg*<sub>1</sub>, *Cg*<sub>2</sub>, *Cg*<sub>3</sub>, *Cg*<sub>4</sub> and *Cg*<sub>5</sub> are the centroids of the C1A–C6A, C8A–C13A, C15A–C20A, C1B–C6B and C8B–C13B benzene rings, respectively.

### Experimental

The title compound was synthesized by adding 2,4-dihydroxybenzaldehyde (0.552 g, 4 mmol) to a solution of *o*-phenylenediamine (0.216 g, 2 mmol) in ethanol (20 ml). The mixture was refluxed with stirring for half an hour. The resultant yellow solution was filtered. Yellow single crystals of the title compound suitable for *x*-ray structure determination were recrystallized from ethanol by slow evaporation of the solvent at room temperature over several days.

## Refinement

Hydroxyl and imine H atoms were located from the difference map and refined riding on the parent atoms with refinement of the isotropic thermal parameters. The remaining H atoms were placed in calculated positions with  $d(C—H) = 0.93 \text{ \AA}$ ,  $U_{\text{iso}}=1.2U_{\text{eq}}(\text{C})$  for aromatic, CH,  $0.96 \text{ \AA}$ ,  $U_{\text{iso}} = 1.5U_{\text{eq}}(\text{C})$  for  $\text{CH}_3$  atoms A rotating group model was used for the methyl groups.

## Figures

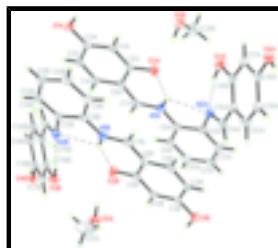

Fig. 1. The asymmetric unit of (I), showing 50% probability displacement ellipsoids and the atomic numbering. Intramolecular O—H···N, N—H···O and N—H···N hydrogen bonds are drawn as dashed lines.

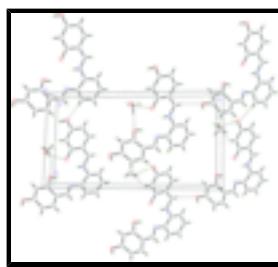

Fig. 2. The crystal packing of (I), viewed along the  $a$  axis, showing the molecular chains along the  $b$  axis. Hydrogen bonds are drawn as dashed lines.

$\gamma = 79.641 (1)^\circ$	Block, yellow
$V = 1826.73 (6) \text{ \AA}^3$	$0.50 \times 0.34 \times 0.17 \text{ mm}$

### Data collection

Bruker SMART APEX2 CCD area-detector diffractometer

10651 independent reflections

Radiation source: fine-focus sealed tube	7203 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.034$
Detector resolution: 8.33 pixels mm <sup>-1</sup>	$\theta_{\text{max}} = 30.0^\circ$
$T = 100.0(1)$ K	$\theta_{\text{min}} = 1.0^\circ$
$\omega$ scans	$h = -11 \rightarrow 10$
Absorption correction: multi-scan (SADABS; Bruker, 2005)	$k = -15 \rightarrow 15$
$T_{\text{min}} = 0.952$ , $T_{\text{max}} = 0.984$	$l = -28 \rightarrow 28$
42593 measured reflections	

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.056$	H-atom parameters constrained
$wR(F^2) = 0.162$	$w = 1/[\sigma^2(F_o^2) + (0.0788P)^2 + 0.3402P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\text{max}} < 0.001$
10651 reflections	$\Delta\rho_{\text{max}} = 0.44 \text{ e \AA}^{-3}$
515 parameters	$\Delta\rho_{\text{min}} = -0.34 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Experimental.** The low-temperature data was collected with the Oxford Cyrosystem Cobra low-temperature attachment.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
