Received 20 May 2008; accepted 28 May 2008

Key indicators: single-crystal X-ray study;  $T = 150$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å; disorder in main residue;  $R$  factor = 0.051;  $wR$  factor = 0.119; data-to-parameter ratio = 19.6.

The title compound,  $\text{C}_{18}\text{H}_{13}\text{Cl}_{11}$ , is an undecachlorinated commercial flame retardant. The asymmetric unit contains two independent half-molecules. The complete molecules are generated by crystallographic inversion symmetry, causing the terminal H atoms and one of the Cl atoms to be disordered equally over two sites in each molecule. The central eight-membered rings are in chair-type conformations. In the crystal structure, there is a single weak intermolecular  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen bond.

### Comment

For background information and related references see the previous paper (Riddell *et al.*, 2008). Dechlorane Plus (DP) is a commercial chlorinated flame retardant used in styrenic plastics (<http://www.inchem.org/documents/ehc/ehc/ehc192.htm>) to protect human life and property against fires. We have synthesized the dechlorinated compound (1*R*,2*R*,5*R*,6*S*,9*R*,10*S*,13*S*,14*S*,18*R*)-1,6,7,8,9,14,15,16,17,17,18- undecachloropentacyclo[12.2.1.1<sup>6,9</sup>.0<sup>2,13</sup>.0<sup>5,10</sup>]-octadeca-7,15-diene. GC/MS and <sup>1</sup>H NMR spectroscopy have confirmed the basic structure of as having the DP-like structure with only 11 chlorine atoms. An NOE NMR experiment also strongly indicated that the proton on the bridging carbon atom was facing towards the cyclooctadiene ring since a positive through space interaction was observed. However, an X-ray structure determination was required to positively confirm the stereochemistry.

The asymmetric unit contains two independent half molecules. The symmetry complete molecules are generated by crystallographic inversion symmetry, causing atoms Cl6A and Cl6B, as well as the H atoms bonded to C9A and C9B to be disordered over two sites with equal occupancies. In both independent molecules the geometric parameters are the same within experimental error. The asymmetric unit is shown in Fig. 2. In the crystal structure there is a single weak intermolecular C—H⋯Cl interaction (Table 1).

### Experimental

The synthesis of the title compound was carried out at Wellington Laboratories using proprietary methods. The compound was isolated and purified using chromatographic techniques. For single-crystal *x*-ray crystallography, colourless crystals were grown from a solution in toluene.

### Refinement

All hydrogen atoms were placed in calculated positions with C—H distances of 0.99 and 1.00 Å and they were included in the refinement in a riding-model approximation with  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$ .

### Figures

Fig. 1. The asymmetric unit of the title compound. Displacement ellipsoids are drawn at the 30% probability level. The disorder is not shown and the atoms labeled with lower case suffixes a and b are related by the symmetry operators  $(-x, -y+1, -z+1)$  and  $(-x+1, -y+1, -z)$  respectively.

### Data collection

Bruker–Nonius KappaCCD diffractometer	5338 independent reflections
Radiation source: fine-focus sealed tube	3481 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.052$
Detector resolution: 9 pixels $\text{mm}^{-1}$	$\theta_{\text{max}} = 27.5^\circ$
$T = 150(2) \text{ K}$	$\theta_{\text{min}} = 2.8^\circ$
$\varphi$ scans and $\omega$ scans with $\kappa$ offsets	$h = -17 \rightarrow 17$
Absorption correction: multi-scan (SORTAV; Blessing, 1995)	$k = -14 \rightarrow 15$
$T_{\text{min}} = 0.715$ , $T_{\text{max}} = 0.825$	$l = -16 \rightarrow 19$
15654 measured reflections	

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.050$	$w = 1/[\sigma^2(F_o^2) + (0.0314P)^2 + 4.5718P]$
$wR(F^2) = 0.118$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\text{max}} < 0.001$
5338 reflections	$\Delta\rho_{\text{max}} = 0.53 \text{ e \AA}^{-3}$
272 parameters	$\Delta\rho_{\text{min}} = -0.68 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: SHELXTL (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Secondary atom site location: difference Fourier map	Extinction coefficient: 0.0011 (3)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
