Received 17 May 2008; accepted 12 June 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.003$ Å; some non-H atoms missing; R factor = 0.046; wR factor = 0.131; data-to-parameter ratio = 13.6.

Pyrazine and 5-sulfosalicylic acid crystallize from a methanol solution containing water as the title salt, $C_4H_6N_2^{2+}\cdot 2C_7H_5O_6S^- \cdot 2H_2O$. The pyrazinedinium cation sits on an inversion center. The component ions and water molecules are linked by intermolecular O—H···O, N—H···O and C—H···O hydrogen bonds into layers running parallel to the (10̄2) plane.

Pyrazinedinium bis(3-carboxy-4-hydroxybenzenesulfonate) dihydrate

J.-R. Wang, Z.-H. Yang, C.-H. Liu and L.-L. Li

Comment

5-sulfosalicylic acid is strong organic acid ($pK_a = 2.85$) which can release its sulfonic acid H to Lewis base N atoms, forming 1:1 molecular adducts in general (Smith *et al.*, 2004 and 2005). In order to gain more insight into these analogues, we have recently prepared an organic salt containing 5-H₂SSA, whose crystal structure is reported here.

There are a half of a pyrazinedinium cation, one each a 5-HSSA⁻ anion and a water molecule in the asymmetric unit. Similarly to analogous organic adducts reported by others (Meng *et al.*, 2008), the H atom is transferred from the sulfonic acid group to the pyrazine N atoms (Fig.1). Except for this, the other bond lengths and angles are usual.

By a combination of seven intermolecular hydrogen bonds (Table 1), these components are linked into a two-dimensional layers (Fig.2) running parallel to the (10 $\bar{2}$) plane in the crystal.

Program PLATON (Spek, 2003) reports two distances indicating possible aromatic π - π stacking interactions between symmetry-center related benzene rings comprising atoms C1 to C6 in this crystal. Centroid distances between the closest symmetry-related benzene rings are 3.848 (2) and 4.239 (2) Å, respectively (symmetry codes: 1-x, 1 -y, 1-z for the former one and 1-x, 2-y, 1-z for the latter one).

Experimental

All the reagents and solvents were used as obtained without further purification. Equimolar amount of pyrazine (0.2 mmol, 16.0 mg) and 5-sulfosalicylic acid dihydrate (0.2 mmol, 50.8 g) were dissolved in 95% methanol (10 ml). The mixture was stirred for ten minutes at ambient temperature and then filtered. The resulting colorless solution was kept in air for two weeks. Plate shaped colorless crystals suitable for single-crystal X-ray diffraction analysis were grown by slow evaporation of the solvent.

Refinement

H atoms bonded to C atoms were positioned geometrically with C—H = 0.93 Å (aromatic) and refined in a riding mode [$U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{aromatic C})$]. H atoms bonded to N and O atoms were found in difference Fourier maps with N—H and O—H distances being refined freely [the refined distances are given in Table 1; $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ or $1.5U_{\text{eq}}(\text{O})$].

Figures

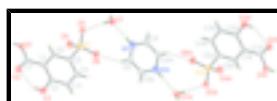

Fig. 1. Molecular structure of the title salt showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. H-bonds are shown in dashed lines. Symmetry code: (A) 2 - x, 1 - y, 2 - z.

supplementary materials

Fig. 2. Excerpt from the crystal structure showing the formation of the two-dimensional layers running parallel to the [102] direction. Hydrogen bonds are shown as dashed lines. For the sake of clarity, H atoms not involved in the motif have been omitted from the drawing.
