Received 19 June 2008; accepted 27 June 2008

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$; R factor = 0.072; wR factor = 0.205; data-to-parameter ratio = 19.6.

In title compound, $\text{C}_{12}\text{H}_9\text{IN}_2\text{O}_2\text{S}$, the nitro group is rotated slightly, by $8.91(3)^\circ$, out of the plane of the aromatic ring to which it is bonded. Between the two aromatic rings the CSN plane is at a dihedral angle of $84.0(7)^\circ$ to the HNC plane. Molecules are linked by $\text{C}-\text{H}\cdots\text{O}$ interactions into a double helical supramolecular architecture. There are no iodo–nitro, $\pi-\pi$ or $\text{C}-\text{H}\cdots\pi(\text{arene})$ interactions.

2-Iodo-N-(2-nitrophenylsulfanyl)aniline

I. Brito, A. Cárdenas, A. Mundaca, M. López-Rodríguez and A. Reyes

Comment

Sulfenamides are important compounds with versatile industrial applications (Kuhle, 1973). Bond polarization in sulfenamide derivatives, resulting from the difference in electronegativity between sulfur and nitrogen, activates the S—N bond for attack by both nucleophiles and electrophiles, and appears to be the factor primarily responsible for the chemistry of these compounds. The title compound, (I), is a positional isomer of 4-Iodo -N-(2-nitrophenylsulfanyl)-aniline (Glidewell *et al.*, 2003) and shows excellent agreement with its bonding geometries. The title compound is the result of the condensation reaction of 2-nitrophenylsulfenyl chloride and 1-iodoaniline. Its structure is described here as part of our work involving the study of the synthesis and structural characterization of divalent-sulfur compounds (Brito *et al.*, 2004, 2005, 2006). A view of the molecular structure of (I) is given in Fig.1. In (I) the 1-Iodo-benzene fragment is connected by an —NH—S— linker unit to the 2-nitrophenyl fragment. It contains an N atom as a chiral center, though the material is a racemic mixture. The nitro group is rotated by 8.91 (3)°. The S—N distance of 1.696 (6) Å is shorter than a normal S—N single-bond length (1.74 Å, Pauling, 1960), but is normal for this type of structure, many of which have S—N single bonds in the range 1.63–1.68 Å as a result of the π character of the S—N bond. The C7/S1/N1 plane makes a dihedral angle of 84.0 (7)° with the H1/N1/C2 plane, in good agreement with the values of ~90.0 ° for the torsional ground state of this type species. The molecules are linked into a double helical supramolecular architecture with only hydrogen bonding contributing to the double helical arrangement (Bernstein *et al.*, 1995). Atom C10 and nitro atom O1 in the molecule at (x, y, z) act as hydrogen-bond donor and acceptor respectively, Fig.2, Table 1. There are no iodo-nitro, π - π and C—H \cdots π (arene) interactions.

Experimental

A sample of compound (I) was prepared by reaction of equimolar quantities of 2-nitrophenylsulfenyl chloride (0.01 mol, 1.895 g) and 4-iodoaniline (0.01 mol, 2.190 g) in dichloromethane solution, in the presence of an excess of triethylamine. Purification was by thin-layer chromatography and crystals of (I) suitable for single-crystal X-ray diffraction were grown by slow evaporation of a solution in ethanol [m.p. 472 K]. FT—IR (KBr pellet, cm^{-1}): ν (w, N—H amine) 3091, ν (w, S—N) 1039, ν (w, C—S) 731, ν (s, C—H disubstitution) 855, ν (versus, NO_2) 1567.

Refinement

All H atoms were initially located in a difference Fourier map and were subsequently refined using a riding model, with C—H distances of 0.93 Å and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ for benzene H atoms and $\text{N—H} = 0.86$ Å for amino H atom and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{N})$.

Refinement

Refinement on F^2	H-atom parameters constrained
Least-squares matrix: full	$w = 1/[\sigma^2(F_o^2) + (0.087P)^2 + 39.1076P]$ where $P = (F_o^2 + 2F_c^2)/3$
$R[F^2 > 2\sigma(F^2)] = 0.072$	$(\Delta/\sigma)_{\max} = 0.001$
$wR(F^2) = 0.205$	$\Delta\rho_{\max} = 1.04 \text{ e \AA}^{-3}$
$S = 1.21$	$\Delta\rho_{\min} = -1.05 \text{ e \AA}^{-3}$
3251 reflections	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$
166 parameters	Extinction coefficient: 0.0064 (7)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
