Received 11 July 2008; accepted 12 July 2008

Key indicators: single-crystal X-ray study;  $T = 299$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å; R factor = 0.027; wR factor = 0.073; data-to-parameter ratio = 15.9.

In the crystal structure of the title compound (N4CPSDCAA),  $\text{C}_8\text{H}_6\text{Cl}_3\text{NO}_3\text{S}$ , the conformations of the N—H and C=O bonds in the  $\text{SO}_2-\text{NH}-\text{CO}-\text{C}$  group are *trans* to each other, similar to those observed in 2,2-dichloro-N-(phenylsulfonyl)-acetamide (NPSDCAA), 2,2-dichloro-N-(4-methylphenylsulfonyl)acetamide (N4MPSDCAA) and *N*-(4-chlorophenylsulfonyl)-2,2,2-trimethylacetamide (N4CPSTMAA), with similar bond parameters. The —SNHCOC— unit in N4CPSDCAA is essentially planar and makes a dihedral angle of 79.67 (5)° with the benzene ring, comparable to 79.75 (8)° in NPSDCAA, 81.02 (5)° in N4MPSDCAA and 82.2 (1)° in N4CPSTMAA. The molecules in N4CPSDCAA are linked into layers parallel to the (001) plane by intermolecular N—H···O hydrogen bonds.

## 2,2-Dichloro-N-(4-chlorophenylsulfonyl)acetamide

B. T. Gowda, S. Foro, P. G. Nirmala, B. P. Sowmya and H. Fuess

### Comment

As part of a study of the substituent effects on the crystal structures of *N*-(aryl)-sulfonamides and substituted amides, in the present work, the structure of *N*-(4-chlorophenylsulfonyl)-2,2-dichloroacetamide (N4CPSDCAA) has been determined (Gowda *et al.*, 2003, 2006; Gowda, Foro, Nirmala *et al.*, 2008; Gowda, Foro, Sowmya *et al.*, 2008). The conformations of the N—H and C=O bonds of the SO<sub>2</sub>—NH—CO—C group in N4CPSDCAA are *trans* to each other (Fig. 1), similar to those observed in *N*-(phenylsulfonyl)-2,2-dichloroacetamide (NPSDCAA), *N*-(4-methylphenylsulfonyl)-2,2-dichloroacetamide (N4MPSDCAA) (Gowda, Foro, Nirmala *et al.*, 2008) and (4-chlorophenylsulfonyl)-2,2,2-trimethylacetamide (N4CPSTMAA) (Gowda, Foro, Sowmya *et al.*, 2008). The bond parameters in N4CPSDCAA are similar to those in NPSDCAA, N4MPSDCAA, N4CPSTMAA (Gowda, Foro, Nirmala *et al.*, 2008; Gowda, Foro, Sowmya *et al.*, 2008), *N*-(aryl)-2,2-dichloro-acetamides (Gowda *et al.*, 2006) and 4-chlorobenzenesulfonamide (Gowda *et al.*, 2003).

The packing diagram of N4CPSDCAA showing the N—H···O hydrogen bonds (Table 1) involved in the formation of layers parallel to the (0 0 1) plane is shown in Fig. 2.

### Experimental

The title compound was prepared by refluxing 4-chlorobenzenesulfonamide (0.10 mole) with excess dichloroacetyl chloride (0.20 mole) for about an hour on a water bath. The reaction mixture was cooled and poured into ice cold water. The resulting solid was separated, washed thoroughly with water and dissolved in warm dilute sodium hydrogen carbonate solution. The title compound was precipitated by acidifying the filtered solution with glacial acetic acid. It was filtered, dried and recrystallized from ethanol. The purity of the compound was checked by determining its melting point. It was characterized by recording its infrared and NMR spectra. Single crystals of the title compound used for X-ray diffraction studies were obtained by slow evaporation of an ethanolic solution.

### Refinement

H atoms were positioned with idealized geometry (C-H = 0.93 or 0.98 Å, N-H = 0.86 Å) and were refined using a riding model, with U<sub>iso</sub>(H) = 1.2U<sub>eq</sub>(C,N). To improve R1, wR2 and S values (1 0 2) reflection was omitted during the refinement

### Figures

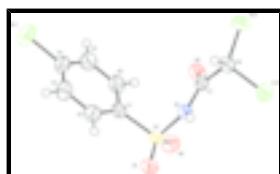

Fig. 1. Molecular structure of the title compound, showing the atom labeling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented as small spheres of arbitrary radii.

	$0.32 \times 0.28 \times 0.08 \text{ mm}$

### Data collection

Oxford Diffraction Xcalibur diffractometer	2309 independent reflections
Radiation source: fine-focus sealed tube	1642 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.020$
$T = 299(2) \text{ K}$	$\theta_{\text{max}} = 26.4^\circ$
$\omega$ and $\varphi$ scans	$\theta_{\text{min}} = 3.1^\circ$
Absorption correction: multi-scan (CrysAlis RED; Oxford Diffraction, 2007)	$h = -11\text{--}11$
$T_{\text{min}} = 0.745$ , $T_{\text{max}} = 0.926$	$k = -10\text{--}12$
10378 measured reflections	$l = -28\text{--}29$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.027$	H-atom parameters constrained
$wR(F^2) = 0.073$	$w = 1/[\sigma^2(F_o^2) + (0.0279P)^2 + 1.2816P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.09$	$(\Delta/\sigma)_{\text{max}} = 0.001$
2309 reflections	$\Delta\rho_{\text{max}} = 0.34 \text{ e \AA}^{-3}$
145 parameters	$\Delta\rho_{\text{min}} = -0.27 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
