Received 16 July 2008; accepted 17 July 2008

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.046; wR factor = 0.127; data-to-parameter ratio = 18.0.

In the title compound, $\text{C}_{15}\text{H}_{26}\text{N}_2\text{O}_2\text{S}$, the cyclohexane and morpholine rings adopt chair conformations, while the thiazole ring has a twist conformation. An intramolecular $\text{C}-\text{H}\cdots\text{S}$ hydrogen-bond interaction forms a five-membered ring. The crystal packing involves $\text{C}-\text{H}\cdots\text{O}=\text{C}$ intermolecular interactions where carbonyl O atoms act as double acceptors to two symmetrically related H atoms.

8-Methyl-4-morpholinoethyl-1-thia-4-azaspiro[4.5]decan-3-one

M. Akkurt, S.P. Yalçın, N. T. Klip and O. Büyükgüngör

Comment

Applications of multi-component reactions (MCRs) in all areas of applied chemistry are very popular because they offer a wealth of products, while requiring only a minimum of effort. The derivatives incorporating the thiazolidine ring system are interesting compounds due to their biological properties. Some 4-thiazolidinones interfere with essential bacterial enzymes (Andres *et al.*, 2000) and they also exhibit antibacterial (Vicini *et al.*, 2006), antimycobacterial (Küçükgüzel *et al.*, 2002), anti-HIV-1 (Barreca *et al.*, 2001), and anticancer activities (Rao *et al.*, 2004). A very recent article deals with similar structures demonstrating potent antiproliferative activity for prostate cancer (Gududuru *et al.*, 2004). As a part of an ongoing investigation on bioactive 4-thiazolidinones and related structures, we report here the synthesis and the crystal structure of title compound (I).

In (I) (Fig. 1), all bond lengths and angles are within normal ranges (Allen *et al.*, 1987). The mean C—S bond length [1.816 (2) Å] is larger than the corresponding values in similar molecules [1.778 (2) Å (Akkurt *et al.*, 2008), and 1.737 (5) Å (Akkurt *et al.*, 2007)]. This may be due to the steric interactions among the sulfur and the other atoms around it.

In the title molecule, the five-membered thiazole ring (C1—C3/N1/S1) is in a twisted conformation, with maximum deviations from best least-square plane of -0.131 (1) and 0.143 (1) Å for atoms S1 and C3, respectively. The cyclohexane and morpholine rings (C3—C8) and (C12—C15/N2/O2) have chair conformations with puckering parameters (Cremer & Pople, 1975) $Q_T = 0.549$ (2) Å, $\theta = 178.8$ (2) ° and $\varphi = 233$ (10) °, and $Q_T = 0.563$ (2) Å, $\theta = 2.8$ (2) ° and $\varphi = 38$ (7) °, respectively.

The molecules are stabilized by intramolecular C—H···S interactions, forming a five-membered ring. The packing of the molecules in the unitcell has a significant C14—H14B···O1?C2ⁱ interaction [symmetry code: (i) $1 + x, y, z$], where O1 acts as a double acceptor to two symmetrically related H14B [$H14B \cdots O1 = 2.65$ Å] (Table 1, Fig. 2).

Experimental

A mixture of morpholinoethylamin (5 mmol), 4-methyl cyclohexanone (5 mmol) and thioglycolicacid (20 mmol) in dry benzene (20 ml) was refluxed for 6 h using a Dean-Stark water separator. Excess solvent was evaporated *in vacuo*. The residue was taken up in chloroform. The chloroform layer was triturated with saturated NaHCO₃ solution (2x) before drying over sodium sulfate and concentrated under reduced pressure to dryness. The crude product was purified by column chromatography on silica gel using hexane: acetone (80:20) as eluent to yield colourless prisms. IR (ν , cm⁻¹): 1672 (C=O). ¹H-NMR (δ , DMSO-d₆, 400 MHz): 0.85 (3H, d, $J=6.0$ Hz, 8-CH₃), 1.09–1.25 (3H, m, cycl. CH), 1.60–1.70 (4H, m, cycl. CH), 1.90–2.05 (2H, m, cycl. CH), 2.30–2.45 (6H, m, morph. N—CH₂), 3.27 (2H, t, $J=7.6$ Hz, N—CH₂), 3.45 (2H, s, SCH₂), 3.53 (4H, t, $J=4.4$ Hz, OCH₂). LC—MS (m/z): 299 ($M+1$). Analysis calculated for C₁₅H₂₆N₂O₂S: C 60.37, H 8.78, N 9.39%. Found: C 59.91, H 8.24, N 9.32%.

supplementary materials

Refinement

All H-atoms were placed in calculated positions [C—H = 0.96–0.97 Å] and were included in the refinement in the riding model approximation, with $U_{\text{iso}}(\text{H})$ set to 1.2 or 1.5 $U_{\text{eq}}(\text{C})$.

The highest residual electron density [0.71 e.Å⁻³] was located at 0.86 Å from atom H1A and the deepest residual electron-density [-0.18 e.Å⁻³] was located at 0.72 Å from atom S1. Probably due to the poor crystal quality, most of the reflections were weak. Analysis of the solvent void using *PLATON* (Spek, 2003) gave that unit cell contains no residual solvent accessible area.

Figures

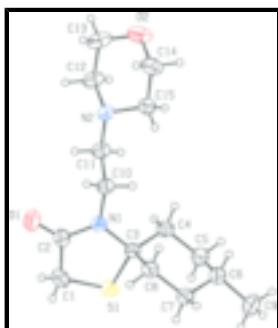

Fig. 1. An *ORTEP* view of the title compound with the atom numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level.

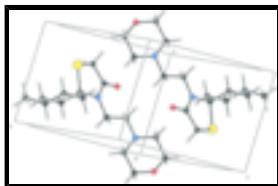

Fig. 2. View of the molecular packing in the unit cell.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.046$	H-atom parameters constrained
$wR(F^2) = 0.127$	$w = 1/[\sigma^2(F_o^2) + (0.07P)^2 + 0.1465P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.07$	$(\Delta/\sigma)_{\text{max}} < 0.001$
3253 reflections	$\Delta\rho_{\text{max}} = 0.72 \text{ e \AA}^{-3}$
181 parameters	$\Delta\rho_{\text{min}} = -0.18 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating - R -factor-obs etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
