Received 13 June 2008; accepted 31 July 2008

Key indicators: single-crystal X-ray study;  $T = 294$  K; mean  $\sigma(C-C) = 0.025$  Å; disorder in solvent or counterion;  $R$  factor = 0.075;  $wR$  factor = 0.219; data-to-parameter ratio = 11.6.

The title compound,  $[Pt_2(C_{16}H_{11}N_2)_2(C_{18}H_{17}N_2P)](ClO_4)_2$ , contains two Pt<sup>II</sup> atoms, bridged by an N-[(diphenylphosphino)methyl]pyridin-2-amine (dppmp) ligand. One Pt atom is coordinated by one P atom from the dppmp ligand, and one C atom and two N atoms from a 6-phenyl-2,2'-bipyridine (pbpy) ligand in a square-planar geometry. The other Pt atom is coordinated by one N atom from the dppmp ligand, and one C atom and two N atoms from another pbpy ligand in a square-planar geometry. There are intramolecular  $\pi$ - $\pi$  interactions between the pbpy ligands, with a centroid-centroid distance of 3.62 (1) Å between two pyridyl rings. The oxygen atoms of both perchlorate anions are disordered, each over two different positions [occupancies 0.49 (3)/0.51 (3) and 0.48 (2)/0.52 (2)].

### Comment

Pyridylphosphines have induced much interest as excellent ligands with both P- and N-donor centres (Kuang *et al.*, 1998; Newkome, 1993). These pyridylphosphines display various coordination modes: P-coordination, N-coordination, P,N-chelating and P,N-bridging (Braunstein *et al.*, 1997; Catalano *et al.*, 2001; Durran *et al.*, 2000; Field *et al.*, 1997; Li *et al.*, 1996). Here, we report the crystal structure of the title compound, in which two Pt<sup>II</sup> atoms are bridged by an *N*-[(diphenylphosphino)methyl]pyridin-2-amine (dppmp) ligand.

In the title compound (Fig. 1), the Pt1 atom is coordinated by one pyridyl N atom from the dppmp ligand, and one C atom and two N atoms from a 6-phenyl-2,2'-bipyridine (pbpy) ligand in a square-planar geometry (Table 1). The Pt2 atom is coordinated by one P atom from the dppmp ligand, and one C atom and two N atoms from another pbpy ligand in a square-planar geometry. The atoms Pt1, N1, N2, N3 and C16 show a mean deviation of 0.01 (1) Å from the least-squares plane through them. The planarity of the coordination geometry around the Pt2 atom was accessed by fitting a least-squares plane to the atoms Pt2, P1, N5, N6 and C50, which show a mean deviation of 0.08 (1) Å. Dihedral angle between the planes defined by two Pt atoms and the corresponding coordinated atoms is 16.6 (2)°.

### Experimental

A solution of K<sub>2</sub>(PtCl<sub>4</sub>) (0.088 g, 0.212 mmol) in water (5 ml) was treated with a solution of pbpy (0.052 g, 0.224 mmol) in MeCN (5 ml) and the mixture was heated to reflux for 20 h, allowing MeCN to evaporate slowly. The orange solid so obtained was collected by filtration, washed with water and water-EtOH (5:l, v/v) and dried *in vacuo*, yielding Pt(pbpy)Cl (yield 91%, 0.089 g). A 15 ml MeCN solution of Pt(pbpy)Cl (0.046 g, 0.1 mmol) was added to a 20 ml MeCN solution of dppmp (0.015 g, 0.05 mmol). The mixture was stirred for 10 h and then LiClO<sub>4</sub> (0.021 g, 0.2 mmol) was added. Yellow crystals suitable for X-ray diffraction were formed by vapour diffusion of diethyl ether into the MeCN solution.

### Refinement

H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 (aromatic) and 0.97 (CH<sub>2</sub>) Å, and N—H = 0.86 Å, and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$ . The highest residual electron density was found 0.98 Å from atom Pt2 and the deepest hole 1.00 Å from atom Pt2. Each perchlorate anion is disordered over two different orientations. The Cl—O distances were restrained to 1.44 (3) Å.
