Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.048; wR factor = 0.130; data-to-parameter ratio = 17.5.

The crystal structure of the title adamantane derivative, $C_{12}H_{18}O_3$, has been determined by X-ray diffraction. The structure is stabilized by intermolecular O—H···O hydrogen bonds, forming a chain.

Comment

Adamantane and its derivatives have an extensive application in the field of medicine. For instance, adamantaneamine has an obvious effect on controlling the exuviating the influenza A virus and it can alleviate the Parkinson symptom (Lu *et al.*, 1996). A large number of compounds containing amantadine have been synthesized (Tukada & Mochizuki, 2005; Zhao *et al.*, 2003). Here we report the synthesis and crystal structure of the title compound (I), illustrated in Fig. 1.

The title compound (I) is an adamantane derivative. Single-crystal X-ray diffraction analyses demonstrate that hydrogen bonding produces an extensive polymeric network since the hydroxyl group substituents are simultaneously hydrogen bonded to the OH of the carboxyl group on an adjacent molecule and the carbonyl group of a different neighbor forming a 12-membered ring as shown in Fig. 2. A 16-membered ring is formed by intermolecular hydrogen bonding between the carbonyl O and hydroxyl H atoms of two molecules. The alternating 12- and 16-membered rings make the compound to form a one-dimensional network.

Experimental

The 3-hydroxy-1-adamantaneacetic was obtained from Zhejiang Key Laboratory for Reactive Chemistry on Solid Surface. Crystals suitable for single-crystal X-ray diffraction were grown by slow evaporation of distilled water.

Refinement

The H atoms bonded to C atoms were positioned geometrically [$C—H = 0.97 \text{ \AA}$, $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$]. The H atoms bonded to O atoms were located in a difference Fourier maps and refined with O—H distance restraints of 0.82 and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$.

Figures

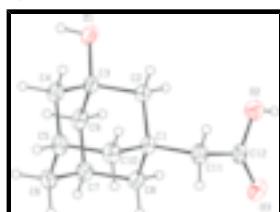

Fig. 1. A view of the molecule of (I), showing the atom-labelling scheme. Displacement ellipsoids are shown at the 30% probability level.

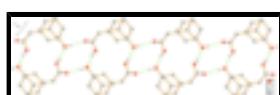

Fig. 2. A packing diagram for the title compound. The O—H···O interactions are depicted by dashed lines.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
