Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.055; wR factor = 0.195; data-to-parameter ratio = 18.7.

In the title compound, $C_9H_{14}O_3$, the cyclohexenone ring has an envelope conformation; the flap atom (with the hydroxymethyl groups attached) is displaced by 0.582 (4) Å from the plane of the other five ring atoms. The crystal structure contains an intermolecular O—H···O hydrogen-bonded ring.

5,5-Bis(hydroxymethyl)-3-methylcyclohex-2-enone

Comment

Functionalized cyclohex-2-enone derivatives can be used as precursors in the syntheses of some complex compounds, such as vitamin E, amino acids, terpenes *etc*. (Hu *et al.*, 2003). In addition, cyclohex-2-enone derivatives have been shown to have a wide range of biological activities such as antimicrobial (Li *et al.*, 2001) and anticancer (Aghil *et al.*, 1992) activities, and are involved in the protection of cerebral neurocytes (Luu *et al.*, 2004). We are interested in their further pharmaceutical activity.

In this paper, we present an X-ray crystallographic analysis of the title compound (I) (Fig. 1). The cyclohexenone ring has an envelope conformation, such that the plane which is composed of atoms C1, C2 and C6 (forming the flap) and the C2, C3, C4, C5, C6 plane form a dihedral angle of 41.80 (4)°. Two molecules are linked together through O—H···O interactions. Since each molecule contains a hydrogen-bond donor group (–OH) at one end and an acceptor (–OH) at the other, a ring of four H-bonds is formed between these two molecules and a neighboring pair in the crystal lattice (Fig. 2).

Experimental

A solution of 4,4-bis(hydroxymethyl)-2,6-heptanedione(188 mg, 1 mmol) and sodium methoxide (54 mg, 1 mmol) in methanol (10 ml) was heated at 323 K for 4 h. The reaction mixture was acidified with dilute aqueous HCl, then concentrated and partitioned between water and dichloromethane. The pure product was obtained through silica gel chromatography (eluant petroleum ether/ethyl acetate, 1:1), and diffraction quality crystals were obtained by slow evaporation of a dichloromethane / petroleum ether (1:3) solution at room temperature.

Refinement

All H atoms were placed in calculated positions, with C—H distances in the range 0.93–0.98Å and included in the final cycles of refinement in the riding-model approximation, with U_{iso}(H) = 1.2Ueq(C).
