Key indicators: single-crystal X-ray study;  $T = 297$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005 \text{ \AA}$ ;  $R$  factor = 0.059;  $wR$  factor = 0.164; data-to-parameter ratio = 13.4.

The asymmetric unit of the title compound,  $C_{20}H_{18}O_8$ , contains two molecules with small geometric differences. The dihedral angles between the benzene rings are 62.94 (12) and 59.99 (12) $^\circ$ . The dihedral angles between the carboxylate groups in the 2- and 3-positions are 81.72 (13) and 65.54 (15) $^\circ$ , respectively. However, the dihedral angles between the carboxylate groups in the 3' and 4'-positions are 67.24 (15) and 59.98 (17) $^\circ$ , respectively.

#### Comment

The title compound is a useful chemical intermediate for the further preparation of various compounds, including, for example, acid, the salts, acyl halides, amides, imides, and the like (Ding *et al.*, 1992). Polymides are well known for possessing excellent thermal and oxidative stability, as well as excellent mechanical properties (Ghosh & Mittal, 1996). The 2,3,3',4'-biphenyltetracarboxylic dianhydride was suggested as a monomer for the synthesis of soluble polyimides with high chemical and thermal stability (Rozhanskii *et al.*, 2000).

The asymmetric unit of **I** contains two crystallographically independent molecules (molecule 1 - C1–C18 and molecule 2 - C19–C38) (Fig. 1). For the molecule 1, the dihedral angle between the two phenyl rings are 62.94 (12) $^{\circ}$  while in the molecule 2 is 59.99 (12) $^{\circ}$  and they are both markedly differ from 42.30 (11) $^{\circ}$  in the 1,1'-biphenyl-2,3,3',4'-etracarboxylic acid monohydrate (Jiang *et al.*, 2008). For the molecule 1, the dihedral angles of the two carboxyl groups placed in 2,3-positions are 81.72 (13) $^{\circ}$  and another two carboxyl groups placed in 3',4'-positions are 67.24 (15) $^{\circ}$ ; for the molecule 2, which are 65.54 (15) $^{\circ}$  and 59.98 (17) $^{\circ}$  respectively. Torsion angles C7—C4—C5—C9 and C27—C24—C25—C29 are 1.4 (4) $^{\circ}$  and 0.9 (4) $^{\circ}$ , respectively. However, torsion angles C19—C14—C15—C17 and C39—C34—C33—C37 are 7.0 (5) $^{\circ}$  and 6.2 (5) $^{\circ}$ , respectively. They are markedly smaller than those for the parent phthalic acid 20.3 $^{\circ}$  (Ermer, 1981).

#### Experimental

2,3,3',4'-biphenyltetracarboxylic dianhydride (29.4 g, 0.1 mol) and *p*-toluenesulfonic acid (2.0 g, 0.01 mol) was dissolved in a solution of toluene (100 ml) and methanol (50 ml) in a three-necked flask equipped with a Dean–Stark trap. The mixture was heated to reflux. After 20 h, water and most of the methanol were removed by azeotropic distillation with toluene. The mixture was allowed to cool and was added subsequently 500 ml of H<sub>2</sub>O. The organic phase was washed three times with saturated Na<sub>2</sub>CO<sub>3</sub> and three times with water. Toluene was removed on a rotary evaporator and the residue was recrystallized in EtOH to afford white powder (34.7 g, 90% yield). Single crystals were grown by slow evaporation of a toluene of solution over a period of several days, m.p. 382–384 K.

#### Refinement

H atoms were positioned geometrically (C—H = 0.93–0.96 Å) and refined using a riding model with the  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}\text{C}$  (for aromatic) and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}\text{C}$  (for methyl).

### Special details

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$  and  $R$ -factors based on ALL data will be even larger.
