Key indicators: single-crystal X-ray study;  $T = 153\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$ ;  $R$  factor = 0.053;  $wR$  factor = 0.209; data-to-parameter ratio = 18.2.

The title compound,  $\text{C}_{25}\text{H}_{22}\text{Br}_2\text{O}_2$ , crystallizes with two molecules in the asymmetric unit. In each independent molecule, the two naphthalene ring systems are nearly perpendicular to one another, with dihedral angles of  $85.6(1)$  and  $86.2(1)^\circ$ . The crystal structure is stabilized by  $\text{C}-\text{H}\cdots\pi$  interactions, and inter- and intramolecular  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{Br}$  hydrogen bonds.

### Bis(3-bromomethyl-2-methoxy-1-naphthyl)methane

#### Comment

Pamoic acid and its derivatives have attracted the attention of some scientists (Kano *et al.*, 1995; Fonge *et al.*, 2007). The involved role has been performed in the pharmaceutical industry for the preparation of medicaments for the treatment of diseases (Haynes *et al.*, 2006). We have synthesized a derivative compound of pamoci acid according to the reported literature (Georghiou *et al.*, 1996; Kondekar & Potlis, 1973; Failla *et al.*, 1993). By reference to the crystal structure reported in the literature (Liu *et al.*, 2006), we report the crystal structure of the title compound, (I), in this paper.

The title compound crystallizes in the triclinic space group P-1 with two independent molecules in an asymmetric unit (Fig. 1). In each molecule, the two naphthalene ring systems are nearly perpendicular to one another. The dihedral angle between the C1—C10 and C14—C23 planes is 85.6 (1) $^{\circ}$  and that between the C26—C35 and C39—C48 planes is 86.2 (1) $^{\circ}$ . The crystal packing is stabilized by C—H $\cdots$  $\pi$  interactions, intermolecular and intramolecular C—H $\cdots$ O and C—H $\cdots$ Br hydrogen bonds (Table 1).

#### Experimental

The title compound was prepared according to the reported procedure of Failla *et al.* (1993). Colourless single crystals suitable for X-ray diffraction were obtained by recrystallization from dichloromethane.

#### Refinement

H atoms were placed in calculated positions with C—H = 0.95–0.99 Å, and refined in riding mode with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . The largest residual electron density was located in the close proximity of Br atom and was deemed meaningless.

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes)

are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
