Received 8 September 2008; accepted 11 September 2008

Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.009\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.058;  $wR$  factor = 0.143; data-to-parameter ratio = 18.6.

The crystal structure of di- $\mu_3$ -chlorido-tetra- $\mu_2$ -chlorido-dichloridocta(imidazole- $\kappa N$ )tetramanganese(II) ethanol 1.234 solvate,  $[\text{Mn}_4\text{Cl}_8(\text{C}_3\text{H}_4\text{N}_2)_8] \cdot 1.234\text{C}_2\text{H}_5\text{O}$  or  $[\text{Mn}_4\text{Cl}_8(\text{Him})_8] \cdot 1.234\text{EtOH}$ , where Him is imidazole ( $\text{C}_3\text{H}_4\text{N}_2$ ), is based upon two  $\text{Mn}_4\text{Cl}_4$  cubes which share one face, and which each lack one manganese vertex, giving a  $\text{Mn}_4\text{Cl}_6$  unit. This contains two different octahedral coordination environments for the Mn atoms. Mn1 is coordinated by four bridging chlorido ligands and two imidazole N atoms, whereas Mn2 is coordinated by three bridging and one terminal Cl and two imidazole N atoms. The remaining two Mn centres are generated by inversion symmetry. A partial occupancy solvent molecule (ethanol) is present. The crystal structure displays several N—H $\cdots$ Cl and N—H $\cdots$ O hydrogen bonds.

## Related literature

Lee *et al.* (2000) reported the structure and magnetic properties of a similar chlorido-bridged tetranuclear cluster of cadmium(II) with 2(2-pyridyl)-4,4',5,5'-tetramethyl-4,5-dihydro-1*H*-imidazol-1-oxy-3-*N*-oxide (NIToPY). For the structure of  $[\{\text{CdCl}_2(\text{Him})_2\}_n]$ , see: Flook *et al.* (1973).

## A tetrานuclear chlorido-bridged manganese(II) cluster with imidazole ligands

M. A. Kurawa, C. J. Adams and A. G. Orpen

### Comment

During our exploration of solid state routes for accessing coordination compounds, we ground CdCl<sub>2</sub> with imidazole to form polymeric  $\{\text{CdCl}_2(\text{Him})_2\}_n$ , whose structure was reported by Flook *et al.* (1973). We sought to synthesize the manganese analogue in a similar fashion by grinding MnCl<sub>2</sub>.4H<sub>2</sub>O with an equimolar amount of imidazole. The resulting polycrystalline powder (of unknown structure) was recrystallized from absolute ethanol to afford a single-crystal. The title compound **I** was obtained, which crystallizes in the triclinic crystal system in the *P*ī space group. The molecule is centrosymmetric, containing four manganese atoms in two different coordination environments and crystallizes across an inversion centre so there is a half a molecule in the asymmetric unit. One type of manganese atom is bonded to four bridging (two  $\mu_2$ -Cl and two  $\mu_3$ -Cl) chlorine atoms, and two imidazole N atoms, completing an octahedral coordination sphere. The second is type is bonded to three bridging (two  $\mu_2$ -Cl and one  $\mu_3$ -Cl) and one terminal chlorine atoms, again with two imidazole N atoms completing octahedral coordination. One of the imidazole ligands shows a carbon-nitrogen disorder, and a partial occupancy solvent molecule (ethanol) is present in the crystal structure, giving rise to N—H···O hydrogen bonds in addition to the N—H···Cl bonds between the chlorine atoms and the imidazole NH donors. The calculated powder pattern of **I** does not match that obtained from the crude material.

### Experimental

1 mmol of MnCl<sub>2</sub>.4H<sub>2</sub>O was ground with 2 mmol of imidazole resulting in the formation of an off-white polycrystalline powder. This was dissolved in absolute alcohol and the resulting solution allowed to evaporate slowly at room temperature, leading to the formation of colourless needle-like crystals.

### Refinement

H atoms were positioned geometrically and refined using a riding model, with C—H = 0.95 (2) Å and N—H = 0.88 (2) Å and  $U_{\text{iso}}(\text{H}) = 1.2$  times  $U_{\text{eq}}(\text{C}, \text{N})$  for the imidazole rings and C—H = 0.99 (2) Å and  $U_{\text{iso}}(\text{H}) = 1.5$  times  $U_{\text{eq}}(\text{C})$  for the ethanol molecule.

### Data collection

Bruker APEX CCD area-detector diffractometer	4920 independent reflections
Radiation source: fine-focus sealed tube	3315 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}}$ = 0.048
T = 173(2) K	$\theta_{\text{max}} = 27.5^\circ$
phi and $\omega$ scans	$\theta_{\text{min}} = 1.7^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 2008a)	$h = -11 \rightarrow 10$
$T_{\text{min}} = 0.815$ , $T_{\text{max}} = 0.850$	$k = -13 \rightarrow 13$
11294 measured reflections	$l = -16 \rightarrow 16$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.058$	H-atom parameters constrained
$wR(F^2) = 0.142$	$w = 1/[\sigma^2(F_o^2) + (0.055P)^2 + 2.417P]$
$S = 1.04$	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} < 0.001$

4920 reflections  $\Delta\rho_{\max} = 1.17 \text{ e \AA}^{-3}$   
 265 parameters  $\Delta\rho_{\min} = -0.77 \text{ e \AA}^{-3}$   
 Primary atom site location: structure-invariant direct Extinction correction: none  
 methods

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
