Received 3 September 2008; accepted 16 September 2008

Key indicators: single-crystal X-ray study; $T = 225\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.033; wR factor = 0.084; data-to-parameter ratio = 38.0.

In the title compound, $[\text{Ni}(\text{C}_{24}\text{H}_{43}\text{P}_2)\text{Cl}]$, the Ni atom adopts a distorted square-planar geometry, with the P atoms of the 2,6-bis[(di-*tert*-butylphosphino)methyl]phenyl ligand *trans* to one another. The P–Ni–P plane is twisted out of the plane of the aromatic ring by $21.97(6)^\circ$.

{2,6-Bis[(di-*tert*-butylphosphino)methyl]phenyl}chloridonickel(II)

B. J. Boro, D. A. Dickie, K. I. Goldberg and R. A. Kemp

Comment

The title compound, (I), was originally prepared by Moulton & Shaw (1976) but its crystal structure was not determined at that time. We have prepared (I) as part of our studies of PCP 'pincer' complexes of divalent late transition metals, which show promise as catalysts for the epoxidation of olefins (Denney *et al.*, 2006; Keith *et al.*, 2006).

In the molecular stucture of (I) (Fig. 1), the nickel adopts a square planar geometry, with the phosphorus atoms *trans* to one another. The Ni—P bond lengths 2.1921 (4) and 2.1978 (4) Å, are significantly shorter than the corresponding Pd—P bonds [2.3039 (6) and 2.3969 (6) Å] in the analogous palladium complex (Kimmich *et al.*, 2002). Steric hindrance distorts the P—Ni—P bond angle to 169.651 (18)°, while the less constrained C—Ni—Cl angle is much closer to linearity at 176.13 (5)°.

Significant geometrical changes are observed in the 2,6-bis[(di-*tert*-butylphosphino)methyl]benzene ligand upon binding to nickel. In the free ligand (Hollink *et al.*, 2003), the average P—C_{methylene} bond length is 1.870 Å, while in (I), it has decreased to 1.8308 (19) Å (P1—C8) and 1.8341 (18) Å (P2—C7). This bond shortening is accompanied by change in the P—C_{methylene}—C_{phenyl} angle, from 114.5° in the free ligand to 106.23 (12)° (P1—C8—C2) and 106.84 (12)° (P2—C7—C6) in (I).

Experimental

A solution of nickel chloride hexahydrate (0.6 g, 2.5 mmol) dissolved in 2 ml of degassed water was added to a solution of 2,6-bis-[(di-*tert*-butylphosphino)methyl]benzene (1.02 g, 2.6 mmol) in 10 ml ethanol. The solution was heated to reflux. A golden-yellow precipitate began to form only after 0.5 h. The solution was stirred under gentle reflux overnight. After cooling, the product was collected by filtration and washed with cold ethanol. It was recrystallized from a concentrated solution of pentane at 238 K.

Refinement

Hydrogen atoms were included at geometrically idealized positions with C—H distances 0.94, 0.97 and 0.98 Å, for aryl, methyl and methylene H-atoms in a riding mode on the respective heavy atoms. The isotropic displacement parameters for the hydrogen atoms were fixed at 1.5 and 1.2 times U_{eq} of the parent methyl and non-methyl C-atoms. An absolute structure was determined (Flack, 1983) employing 4507 Friedel pairs of reflections which were not merged.

Data collection

Bruker SMART CCD area-detector diffractometer	10074 independent reflections
Radiation source: fine-focus sealed tube	8461 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.048$
$T = 225(2) \text{ K}$	$\theta_{\max} = 33.2^\circ$
φ and ω scans	$\theta_{\min} = 1.9^\circ$
Absorption correction: empirical (using intensity measurements) (SADABS; Bruker, 2004)	$h = -17 \rightarrow 17$
$T_{\min} = 0.622$, $T_{\max} = 0.679$	$k = -23 \rightarrow 23$
84881 measured reflections	$l = -23 \rightarrow 23$

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.033$	$w = 1/[\sigma^2(F_o^2) + (0.0439P)^2]$
$wR(F^2) = 0.084$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.09$	$(\Delta/\sigma)_{\max} = 0.002$
10074 reflections	$\Delta\rho_{\max} = 0.32 \text{ e \AA}^{-3}$
	$\Delta\rho_{\min} = -0.50 \text{ e \AA}^{-3}$

265 parameters
 Primary atom site location: structure-invariant direct Extinction correction: none
 methods Absolute structure: Flack (1983), with 4507 Friedel
 pairs
 Secondary atom site location: difference Fourier map Flack parameter: 0.006 (7)

Special details

Experimental. Yield = 60%. ^1H NMR (250 MHz, C_6D_6) δ 7.00 (t, 1H, $^3J_{\text{HH}} = 7.4$ Hz, Ar- H_{para}), 6.84 (d, 2H, $^3J_{\text{HH}} = 7.4$ Hz, Ar- H_{meta}), 2.91 (virtual t, 4H, $J_{\text{HP}} = 6.8$ Hz, CH_2), 1.40 (virtual t, 36H, $J_{\text{HP}} = 12.7$ Hz, CH_3) p.p.m. $^{13}\text{C}\{^1\text{H}\}$ NMR (63 MHz, C_6D_6) δ 155.7 (t, $^2J_{\text{CP}} = 16.7$ Hz, Ar- C_{ipso}), 153.0 (virtual t, $J_{\text{CP}} = 25.5$ Hz, Ar- C_{ortho}), 125.2 (s, Ar- C_{para}), 121.8 (virtual t, $J_{\text{CP}} = 16.7$ Hz, Ar- C_{meta}), 34.9 (virtual t, $J_{\text{CP}} = 13.4$ Hz, PCH_2), 34.3 (virtual t, $J_{\text{CP}} = 22.7$ Hz, $\text{PC}(\text{CH}_3)_3$), 29.8 (s, CH_3) p.p.m. $^{31}\text{P}\{^1\text{H}\}$ NMR (101 MHz, C_6D_6) δ 66.9 p.p.m.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
