Received 23 September 2008; accepted 24 September 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.015$ Å; R factor = 0.067; wR factor = 0.183; data-to-parameter ratio = 24.1.

In the molecule of the title compound, $[HgI_2(C_{24}H_{16}N_2)]$, the Hg^{II} atom is four-coordinated in a distorted tetrahedral configuration by two N atoms from the bidentate 4,7-diphenyl-1,10-phenanthroline and two iodide ligands. There is a $\pi-\pi$ contact between the pyridine and phenyl rings [centroid-to-centroid distance = 4.2387 (4) Å].

Comment

Recently, we reported the syntheses and crystal structures of $[Zn(5,5'-dmbpy)Cl_2]$, (II), (Khalighi *et al.*, 2008), $[Zn(6-mbpy)Cl_2]$, (III), (Ahmadi, Kalateh, Abedi *et al.*, 2008), $[Cd(5,5'-dmbpy)(\mu-Cl)_2]_n$, (IV), (Ahmadi, Khalighi *et al.*, 2008), $[Hg(5,5'-dmbpy)I_2]$, (V), (Tadayon Pour *et al.*, 2008), $[In(4,4'-dmbpy)Cl_3(DMSO)]$, (VI), (Ahmadi, Khalighi, Ebadi *et al.*, 2008), $[Cu(5,5'-dc bpy)(en)(H_2O)_2] \cdot 2.5H_2O$, (VII), (Yousefi, Khalighi *et al.*, 2008), $[Au(dmphen)Cl_2][AuCl_4]$, (VIII), (Ahmadi, Amani *et al.*, 2008), and $\{[HgCl(dm4bt)]_2(\mu-Cl)_2\}$, (IX), (Khavasi *et al.*, 2008). [where 5,5'-dmbpy is 5,5'-dimethyl-2,2'-bipyridine, 6-mbpy is 6-methyl-2,2'-bipyridine, 4,4'-dmbpy is 4,4'-dimethyl-2,2'-bi-pyridine, DMSO is dimethyl sulfoxide, 5,5'-dc bpy is 2,2'-bipyridine-5,5'-di-carboxylate, en is ethylenediamine, dmphen is 4,7-diphenyl-1,10-phenanthroline and dm4bt is 2,2'-dimethyl-4,4'-bithiazole]. There are several Hg^{II} complexes, with formula, $[HgI_2(N-N)]$, such as $[HgI_2(bipy)]$, (X), $[HgI_2(phen)]$, (XI) and $[HgI_2(2,9-dmphen)]$, (XII), (Freire *et al.*, 1999), $[HgI_2(bipy)][HgI_2]$, (XIII), (Chen *et al.*, 2006), $[HgI_2(4,4'-dmbpy)]$, (XIV), (Yousefi, Tadayon Pour *et al.*, 2008) and $[HgI_2(TM DMA)]$, (XV), (Htoon & Ladd, 1976) [where bipy is 2,2'-bipyridine, phen is 1,10-phenanthroline, dmphen is 2,9-dimethyl-1,10-phenanthroline and TM DMA is tetramethylethylenediamine] have been synthesized and characterized by single crystal X-ray diffraction methods. We report herein the synthesis and crystal structure of the title compound, (I).

In the title compound, (Fig. 1), the Hg^{II} atom is four-coordinated in a distorted tetrahedral configuration by two N atoms from 4,7-diphenyl-1,10-phenanthroline and two I atoms. The Hg—I and Hg—N bond lengths and angles (Table 1) are within normal ranges, as in (X), (XI) and (XIV).

In the crystal structure, the $\pi-\pi$ contact (Fig. 2) between the pyridine and phenyl rings, $Cg3 \cdots Cg4^i$ [symmetry code: (i) $3/2 - x, -1/2 + y, 1/2 - z$, where Cg3 and Cg4 are centroids of the rings (N1/C1—C3/C10/C24) and (C4—C9), respectively] may stabilize the structure, with centroid–centroid distance of 4.2387 (4) Å.

Experimental

For the preparation of the title compound, a solution of 4,7-diphenyl-1,10-phenanthroline (0.36 g, 1.10 mmol) in acetonitrile (20 ml) was added to a solution of HgI_2 (0.50 g, 1.10 mmol) in methanol (20 ml) and the resulting colorless solution was stirred for 20 min at 313 K. This solution was left to evaporate slowly at room temperature. After one week, colorless block crystals of the title compound were isolated (yield; 0.62 g, 71.6%).

Refinement

H atoms were positioned geometrically, with C—H = 0.93 Å for aromatic H and constrained to ride on their parent atoms with $U_{iso}(H) = 1.2U_{eq}(C)$.

Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0086 (6)
Secondary atom site location: difference Fourier map	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
