Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  
 $R$  factor = 0.053;  $wR$  factor = 0.167; data-to-parameter ratio = 13.2.In the crystal structure of the title compound,  $\text{C}_8\text{H}_{10}\text{N}_2\text{O}_3$ , molecules are linked by  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds, forming ribbons of centrosymmetric dimers extending along the  $c$  axis.

## Methyl (1*H*-pyrrol-2-ylcarbonylamino)acetate

G. H. Tang, D. D. Li, X. C. Zeng, S. S. Dong and Y. S. Wang

### Comment

Pyrrole derivatives are well known in many marine organisms (Faulkner, 2002). Some show important bioactivities, such as antitumor activity (Banwell *et al.*, 2006) and protein kinase inhibiting activity (Sosa *et al.*, 2002). This is the reason why they have attracted our interest. This study follows our previous studies on methyl 2-(4,5-dibromo-1*H*-pyrrole-2-carboxamido)propionate (Zeng *et al.*, 2007) and 3-bromo-1-methyl-6,7-dihydropyrrolo[2,3-*c*]azepine- 4,8(1*H*,5*H*)-dione (Zeng, 2006).

In the crystal structure, molecules of the title compound are linked through N1—H1 $\cdots$ O1<sup>i</sup> hydrogen bonds to form centrosymmetric dimers (Fig. 2) of graph-set motif  $R_2^2(10)$  (Bernstein *et al.*, 1995), which are linked by N2—H2 $\cdots$ O2<sup>ii</sup> hydrogen bonds, generating ribbons extending along the *c* axis (also shown in Fig. 2). Bond lengths and angles are unexceptional.

### Experimental

The hydrochloric acid salt of glycine methyl ester (0.63 g, 5 mmol) and 2-trichloroacetylpyrrole (1.06 g, 5 mmol) were added to acetonitrile (12 ml), followed by the dropwise addition of triethylamine (1.4 ml). The mixture was stirred at room temperature for 10 h and then poured into water. After filtration, the precipitate was collected as a yellow solid. The impure product was dissolved in EtOH at room temperature. Light-yellow monoclinic crystals suitable for X-ray analysis (m.p. 420 K, 95.6% yield) grew over a period of one week when the solution was exposed to the air. CH&N elemental analysis. Calc. for C<sub>8</sub>H<sub>10</sub>N<sub>2</sub>O<sub>3</sub>: C 52.74, H 5.53, N 15.38%; found: C 52.78, H 5.59, N 15.49%.

### Refinement

H atoms were positioned geometrically [C—H = 0.99 Å for CH<sub>2</sub>, 0.98 Å for CH<sub>3</sub>, 0.95 Å for CH (aromatic), and N—H = 0.88 Å] and refined using a riding model, with  $U_{\text{iso}} = 1.2U_{\text{eq}}$  (1.5 $U_{\text{eq}}$  for the methyl group) of the parent atom.

### Figures

Fig. 1. The molecular structure of the title compound, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

Fig. 2. Ribbons of dimers formed by hydrogen bonds (dashed lines).

*Data collection*

Bruker SMART 1K CCD area-detector diffractometer

Radiation source: fine-focus sealed tube

Monochromator: graphite

$T = 173$ (2) K

$\varphi$  and  $\omega$  scans

Absorption correction: multi-scan (SADABS; Sheldrick, 1997)

$T_{\min} = 0.952$ ,  $T_{\max} = 0.979$

4219 measured reflections

1576 independent reflections

1417 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.033$

$\theta_{\max} = 25.0$ °

$\theta_{\min} = 1.9$ °

$h = -13 \rightarrow 13$

$k = -6 \rightarrow 5$

$l = -16 \rightarrow 19$

*Refinement*

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.052$

$wR(F^2) = 0.166$

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.1092P)^2 + 0.2414P]$

$S = 1.10$

1576 reflections

119 parameters

Primary atom site location: structure-invariant direct methods

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$

$\Delta\rho_{\max} = 0.21 \text{ e } \text{\AA}^{-3}$

$\Delta\rho_{\min} = -0.31 \text{ e } \text{\AA}^{-3}$

Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
