

## 4-Methyl-3-nitrobenzonitrile

Li-Jing Cui and Jing Dai\*

Ordered Matter Science Research Center, College of Chemistry and Chemical Engineering, Southeast University, Nanjing 210096, People's Republic of China.  
Correspondence e-mail: fudavid88@yahoo.com.cn

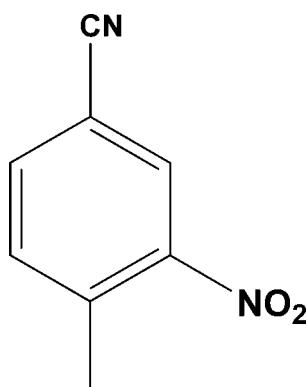

Received 29 July 2008; accepted 26 August 2008

Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  
 $R$  factor = 0.068;  $wR$  factor = 0.208; data-to-parameter ratio = 16.1.

In the title compound,  $\text{C}_8\text{H}_6\text{N}_2\text{O}_2$ , the nitro group is rotated by  $23.2(3)^\circ$  out of the plane of the benzene ring. The crystal structure is stabilized by van der Waals interactions.

## 4-Methyl-3-nitrobenzonitrile

L.-J. Cui and J. Dai

### Comment

Nitrile derivatives have found a wide range of applications in industry and coordination chemistry as ligands. For example, phthalonitriles have been used as starting materials for phthalocyanines (Jin *et al.*, 1994), which are important components for dyes, pigments, gas sensors, optical limiters and liquid crystals, and which are also used in medicine, as singlet oxygen photosensitisers for photodynamic therapy (Brewis *et al.*, 2003). Also, nitrile compounds are the precursors of tetrazole complexes (Dunica *et al.* (1991); Xiong *et al.* (2002)). Recently, a series of benzonitrile compounds have been reported (Fu & Zhao, 2007; Liang & Wang, 2008). As an extension of these studies on structural characterization, we report here the crystal structure of the title compound, *p*-methyl-*m*-nitrobenzonitrile.

The crystal data show that in the title compound (Fig. 1), the benzene ring and the nitro group are not coplanar, they are twisted with respect to each other by torsion angles of O1—N1—C1—C6 ( $-23.2(4)^\circ$ ) and O2—N1—C1—C2 ( $-25.6(3)^\circ$ ); the nitrile group C8≡N2 bond length of 1.144 (3) Å is within the normal range. The crystal structure is stabilized only by van der Waals interactions.

### Experimental

The purchased *p*-methyl-*m*-nitrobenzonitrile (3 mmol, 486.44 mg) was dissolved in chloroform (20 ml) and evaporated in air, affording colorless block crystals of this compound suitable for X-ray analysis.

### Refinement

All H atoms bonded to C atoms were fixed geometrically and treated as riding with C—H = 0.93 Å (aromatic), C—H = 0.96 Å (methyl), with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{aromatic C})$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{methyl C})$ .

### Figures

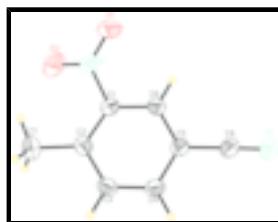

Fig. 1. A view of the molecular structure of the title compound, with the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented by spheres of arbitrary radius.

$Z = 4$	$0.35 \times 0.30 \times 0.1 \text{ mm}$

## Data collection

Rigaku Mercury2 diffractometer	1761 independent reflections
Radiation source: fine-focus sealed tube	1336 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.037$
Detector resolution: 13.6612 pixels $\text{mm}^{-1}$	$\theta_{\text{max}} = 27.5^\circ$
$T = 298(2) \text{ K}$	$\theta_{\text{min}} = 3.0^\circ$
$\omega$ scans	$h = -5 \rightarrow 5$
Absorption correction: multi-scan (CrystalClear; Rigaku/MSC, 2005)	$k = -17 \rightarrow 17$
$T_{\text{min}} = 0.965, T_{\text{max}} = 0.990$	$l = -19 \rightarrow 19$
7589 measured reflections	

## Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.068$	H-atom parameters constrained
$wR(F^2) = 0.208$	$w = 1/[\sigma^2(F_o^2) + (0.1036P)^2 + 0.2336P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.10$	$(\Delta/\sigma)_{\text{max}} < 0.001$
1753 reflections	$\Delta\rho_{\text{max}} = 0.33 \text{ e \AA}^{-3}$
109 parameters	$\Delta\rho_{\text{min}} = -0.28 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
