Received 12 August 2008; accepted 5 September 2008

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.036;  $wR$  factor = 0.107; data-to-parameter ratio = 13.2.

The molecule of the centrosymmetric title compound,  $\text{C}_{18}\text{H}_{20}\text{N}_2\text{O}_6$ , assumes an *E* configuration with respect to the azomethine  $\text{C}=\text{N}$  bond. The imino group is coplanar with the aromatic ring. Intramolecular  $\text{O}-\text{H}\cdots\text{O}$  and  $\text{O}-\text{H}\cdots\text{N}$  bonds are found between the hydroxyl groups and adjacent O (or N) atoms. In the crystal structure, intermolecular  $\text{O}-\text{H}\cdots\text{O}$  bonds link each molecule to two others, forming a layered network.

## 6,6'-Dihydroxy-2,2'-[butane-1,4-diyldioxy]bis(nitrilomethylidyne)diphenol

**W.-K. Dong, X.-N. He, Y.-X. Sun, L. Xu and Y.-H. Guan**

### Comment

The design of supramolecular structures involves molecules for which intermolecular hydrogen bonds act as driving, directional and cohesive forces (Sharma, 2002). Although many stable and well documented structures have been reported (Fan *et al.*, 2006; Wang *et al.*, 2003), the supramolecular structures of salen-type bisoxime compounds have rarely been determined. The first reported supramolecular salen-type bisoxime compound, 6,6'-dihydroxy-2,2'-[ethylenedioxybis(nitrilomethylidyne)]diphenol has an intermolecular hydrogen bond network involving four hydroxyl groups and cocrystallized water molecules (Akine *et al.*, 2006). In this article, we report the synthesis and structure of the title compound (I) (Fig. 1).

(I) lies across a crystallographic inversion centre to give 1/2 molecule per asymmetric unit. It assumes an E configuration with respect to the azomethine C=N bond. The imino group is coplanar with the aromatic ring. The planar units are parallel to one another but extend in opposite directions from the tetramethylene bridge. Strong intramolecular O(3)—H(3)···O(2) and O(2)—H(2)···N(1) bonds are found between the hydroxyl groups and adjacent O (or N) atoms (Table 1). This is similar to what was observed in our previously reported salen-type bisoxime compounds (Wang *et al.*, 2007; Dong *et al.*, 2007; Dong *et al.*, 2008a).

In the crystal packing weak intermolecular O—H···O hydrogen bonds link each molecule to 4 others, forming an infinite three-dimensional supramolecular structure (Figs. 2 and 3) that differs from the structures of 6,6'-dihydroxy-2,2'-[ethylenedioxybis(nitrilomethylidyne)]diphenol (Akine *et al.*, 2006) and 6,6'-dihydroxy-2,2'-[pentane-1,5-diyldioxy]bis(nitrilomethylidyne)diphenol (Dong *et al.*, 2008b), in which the molecules exhibit one-dimensional chains formed through strong intermolecular π–π stacking interactions or weak intermolecular hydrogen bonds.

### Experimental

The title compound was synthesized according to an analogous method reported earlier (Dong *et al.*, 2007). To an ethanol solution (5 ml) of 2,3-dihydroxybenzaldehyde (276.6 mg, 2.0 mmol) was added an ethanol solution (5 ml) of 1,4-bis(aminooxy)butane (120.0 mg, 1.0 mmol). After the solution had been stirred at 328 K for 3 h, the reaction mixture was separated by filtration, washed successively with ethanol and ethanol/hexane (1:4), respectively. The product was dried under reduced pressure and purified with recrystallization from ethanol to yield 59.9 mg of pale-brown crystalline solid. Yield, 17.2%, m.p. 388–389 K. Anal. Calc. (%) for C<sub>18</sub>H<sub>20</sub>N<sub>2</sub>O<sub>6</sub>: C, 59.99; H, 5.59; N, 7.77. Found: C, 60.23; H, 5.45; N, 7.60.

Block-shaped crystals of (I) suitable for X-ray crystal analysis were grown from a mixture of tetrahydrofuran/ethanol (1:1) solution by slow evaporation at room temperature, which afforded pale-brown crystals.

## Refinement

Non-H atoms were refined anisotropically. H atoms were treated as riding atoms with distances C—H = 0.97 (CH<sub>2</sub>), 0.93 Å (CH), O—H = 0.82 Å and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  and  $1.5 U_{\text{eq}}(\text{O})$ .

## Figures

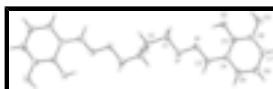

Fig. 1. The molecular structure of the title compound with atom numbering scheme [Symmetry codes:  $-x, -y + 2, -z + 1$ ]. Displacement ellipsoids for non-hydrogen atoms are drawn at the 30% probability level.

Fig. 2. Three-dimensional packing diagram of the title compound along  $c$  axis showing the E configuration.

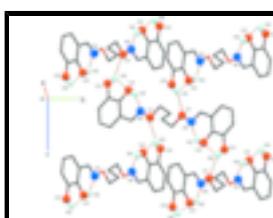

Fig. 3. Part of the supramolecular structure of the title compound along  $b$  axis. Intra- and intermolecular hydrogen bonds are shown as dashed lines.

Extinction correction: none

### *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
