Received 14 August 2008; accepted 8 September 2008

Key indicators: single-crystal X-ray study; $T = 295\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.026; wR factor = 0.064; data-to-parameter ratio = 18.0.

In the centrosymmetric title compound, $C_{18}H_{28}Br_2O_2$, the alkyl chains adopt a fully extended all-*trans* conformation and each of them is almost planar. In addition, the alkyl chains are coplanar with the benzene ring. Intermolecular $\text{Br}\cdots\text{Br}$ interactions [3.410 (3) \AA] are present, resulting in a one-dimensional supramolecular architecture.

Comment

Noncovalent interactions play an important role in designing superstructures (Brammer, 2004). Among these weak forces, the intermolecular interactions between halogen atoms have been a subject of interest (Desiraju *et al.*, 1989). In order to gain more insight into the structure-regulating ability of intermolecular Br···Br interactions, herein we report the crystal structure of the title compound.

A view of the centrosymmetric molecular structure of the title compound is given in Fig. 1. The alkyl chains are in the fully extended all-*trans* conformation and each of them is almost perfectly planar. The C—C—O—C torsion angles of 3.4 (4) $^{\circ}$, indicate that the two alkyl chains are coplanar with the benzene ring. The crystal structure of the title compound reveals the presence of a near linear C—Br···Br fragment [C—Br···Br=155.6 (3) $^{\circ}$], the Br···Br distance (3.410 Å) is shorter than the sum of van der Waals radii (3.72 Å) and those in the other compound [3.634 (4)–3.9527 (9) Å] (Kuriger *et al.*, 2008; Ali *et al.*, 2008). Owing to the intermolecular Br···Br interactions, the crystal structure of the title compound is extended to a one-dimensional chain structure. The chains are intercalated by van der Waals forces (Fig. 2).

Experimental

The title compound was prepared as described in literature (Maruyama & Kawanishi 2002) and recrystallized from dichloromethane-ethanol at room temperature to give the desired crystals suitable for single-crystal X-ray diffraction.

Refinement

H atoms attached to C atoms of the title compound were placed in geometrically idealized positions and treated as riding with C—H distances constrained to 0.93 (aromatic CH), or 0.96 Å (methyl CH₃), and 0.97 Å (methylene CH₂) and constrained to ride on their parent atoms, with $U_{\text{iso}}\sim(\text{H}) = 1.2U_{\text{eq}}(\text{C})(1.5U_{\text{eq}}$ for methyl H).

Figures

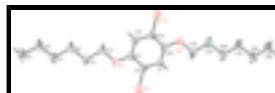

Fig. 1. The molecular structure of the title compound with displacement ellipsoids at the 50% probability level. Inversion related atoms are labelled with an A. (Symmetry code: - x , 1 - y , - z).

Fig. 2. Partial view of the crystal packing showing the formation of the infinite chains of molecules formed by the intermolecular Br···Br interactions. Intercalated neighboring chains complete the sheets in the structure running parallel to (100). H atoms have been omitted for clarity.

	0.28 × 0.27 × 0.07 mm

Data collection

Bruker SMART CCD diffractometer	1818 independent reflections
Radiation source: fine-focus sealed tube	1567 reflections with $I > 2\sigma(I)$
Monochromator: graphite	R_{int} = 0.018
T = 295(2) K	$\theta_{\text{max}} = 25.5^\circ$
phi and ω scans	$\theta_{\text{min}} = 2.7^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -8 \rightarrow 8$
$T_{\text{min}} = 0.391$, $T_{\text{max}} = 0.764$	$k = -9 \rightarrow 9$
3675 measured reflections	$l = -11 \rightarrow 11$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.025$	H-atom parameters constrained
$wR(F^2) = 0.063$	$w = 1/[\sigma^2(F_o^2) + (0.0346P)^2 + 0.0096P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\text{max}} = 0.001$
1818 reflections	$\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$
101 parameters	$\Delta\rho_{\text{min}} = -0.23 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
