## Redetermination of the distorted perovskite $\mathrm{Nd}_{0.53} \mathrm{Sr}_{0.47} \mathrm{MnO}_{3}$

Ryoko Makita, ${ }^{\text {a* }}$ Kiyoaki Tanaka, ${ }^{\text {a }}$ Masato Kubota ${ }^{\text {b }}$ and Youichi Murakami ${ }^{\text {c }}$<br>${ }^{\text {a }}$ Graduate School of Materials Science \& Engineering, Nagoya Institute of Technology, Gokiso-cho, Showa-ku, Japan, ${ }^{\mathbf{b}}$ Photon Factory, IMSS, High Energy Accelerator Research Organization (KEK), Tsukuba, 305-0801, Japan, and ${ }^{\text {c }}$ Materials Structure Physics Group, Department of Physics, Graduate School of Science, Tohoku University, Sendai 980-8578, Japan<br>Correspondence e-mail: 14515020@stn.nitech.ac.jp

Received 18 September 2008; accepted 20 October 2008

Key indicators: single-crystal X-ray study; $T=241 \mathrm{~K}$; mean $\sigma(\mathrm{Mn}-\mathrm{O})=0.001 \AA$; disorder in main residue; $R$ factor $=0.028 ; w R$ factor $=0.066$; data-to-parameter ratio $=14.3$

Neodymium strontium manganese oxide with ideal composition $\mathrm{Nd}_{0.5} \mathrm{Sr}_{0.5} \mathrm{MnO}_{3}$ was reported to have two different structure models. In one model, the $x$ coordinate of an O atom is at $x>1 / 2$, while in the other model the $x$-coordinate of this atom is at $x<1 / 2$. Difference-density maps around this O atom obtained from the current redetermination clearly show that the structure with the O atom at $x<1 / 2$ result in a more satisfactory model than that with $x>1 / 2$. The title compound with a refined composition of $\mathrm{Nd}_{0.53(5)} \mathrm{Sr}_{0.47(5)} \mathrm{MnO}_{3}$ is a distorted perovskite-type structure with site symmetries 2 mm for the statistically occupied ( $\mathrm{Nd}, \mathrm{Sr}$ ) site and for the abovementioned O atom, $.2 / m$. for the Mn atom and .. 2 for a second O -atom site. In contrast to previous studies, the displacement factors for all atoms were refined anisotropically.

## Comment

Woodward et al. (1998) and Caignaert et al. (1998) determined the structure of $\mathrm{Nd}_{0.5} \mathrm{Sr}_{0.5} \mathrm{MnO}_{3}$ on the basis of powder X-ray diffraction data, whereas Kajimoto (1999) and Angappane et al. (2004) used single-crystal X-ray diffraction data for structure refinements. Except the model reported by Woodward et al. (1998), for all other structure models of $\mathrm{Nd}_{0.5} \mathrm{Sr}_{0.5} \mathrm{MnO}_{3}$ the $x$-coordinate of oxygen atom O1 was reported to be $>1 / 2$. Since a new examination of the $x$-coordinate of O1 seemed desirable and anisotropic displacement factors were not reported in the previous studies, we decided to redetermine the structure of $\mathrm{Nd}_{0.45} \mathrm{Sr}_{0.55} \mathrm{MnO}_{3}$. The result of the structure analysis is presented in this communication.

The structure of the title compound derives from the perovskite-type (Fig. 1) and exhibits an orthorhombic distortion. The site symmetries are 2 mm for the statistically occupied $\left[(\mathrm{Nd}, \mathrm{Sr}) \mathrm{O}_{12}\right.$ ] polyhedron and for $\mathrm{O} 1, .2 / m$. for the distorted $\left[\mathrm{MnO}_{6}\right]$ octahedron and .. 2 for O 2 .

## Experimental

A large single crystal was grown using a floating zone method (Nakamura et al., 1999). The bulk sample was put on a piece of filter paper and was etched by diluted nitric acid under a microscope. Finally, the sample was shaped into a $0.040 \mathrm{~mm} \times$ $0.053 \mathrm{~mm} \times 0.065 \mathrm{~mm}$ block. $\mathrm{Nd}_{0.45} \mathrm{Sr}_{0.55} \mathrm{MnO}_{3}$ exhibits a first order phase transition at $\mathrm{T}_{\mathrm{N}}=225 \mathrm{~K}$. The present diffraction study was carried out at 241 (1) K close to the phase transition temperature.

## Refinement

The structure of $\mathrm{Nd}_{1-x} \mathrm{Sr}_{x} \mathrm{MnO}_{3}$ changes with the hole-concentration $x$. In the region $x>0.55$ the structure has tetragonal symmetry. However, at $x=0.60$ a phase with monoclinic symmetry was reported at low temperature (Kajimoto et al. , 1999). Below $x=0.55$ it changes to orthorhombic symmetry. Since crystals with monoclinic, orthorhombic and tetragonal symmetries were found in preliminary experiments for crystal with approximate compositions of $\mathrm{Nd}_{0.45} \mathrm{Sr}_{0.55} \mathrm{MnO}_{3}$ (which is expected from the composition of the starting materials), the hole-concentration $x$ (i.e. site occupation factors) were also refined besides the atomic coordinates and the temperature factors. The previous studies (Woodward et al. (1998); Caignaert et al. (1998); Angappane et al. (2004)) have used the standard setting of space group No. 74 in Imma. We decided to refine the structure with the setting in Ibmm , because in the orthorhombic phase the crystal axis is taken along the same direction as that of the tetragonal phase which is also adopted by many other physicists to make clear the relationships between the two phases. Furthermore, $\mathrm{Nd}_{0.45} \mathrm{Sr}_{0.55} \mathrm{MnO}_{3}$ is well known as having $\mathrm{dx}^{2}-\mathrm{y}^{2}$ - type orbital-ordering of Mn and the physical and chemical properties are discussed based on the $I b m m$ setting.

When the coordinates by Caignaert et al. (1998) were used as starting parameters for refinement, the $x$-coordinate of O1 converged to 0.518 (1) with a $R$-factor of 0.0381 . Fig. $2(a)$ shows the difference density map onto ( 010 ) after this refinement in the range $0<z<1 / 2$ and $0<x<1$ with the vertical and horizontal lengths of $3.80 \AA \times 5.48 \AA$. The cores of $\mathrm{Nd} / \mathrm{Sr}, \mathrm{Mn}$

## supplementary materials

and O 1 are at $(0,1 / 4),(1 / 2,1 / 2)$ and $(0.52,1 / 4)$. Since there are two high peaks at $x=0.45$ and 0.55 in Fig $2(a)$, O1 was split into $\mathrm{O} 1(1)$ at $x=0.45$ and $\mathrm{O} 1(2)$ at $x=0.55$. The site occupation factors of $\mathrm{O} 1(1)$ and $\mathrm{O} 1(2)$ became 0.96 (6) and 0.04 (6) after the refinement. Hence O1 was concluded to be located only at $x=0.45$. After the subsequent refinement the $R$-factor converged at 0.0289 and the difference density map became likewise more satisfactory (Fig. 2(b)).

Although the temperature factor $U^{33}$ of O 1 is 0.001 (1) $\AA^{2}$ and almost insignificant, it becomes 0.0015 (2) $\AA^{2}$ after the refinement of anharmonic vibration parameters (Dawson et al., 1967; Tanaka \& Marumo, 1983) as well as the harmonic ones. Finally, refinement of the site occupation factors revealed a hole-concentration $x$ of 0.47 (5) thus leading to a composition of $\mathrm{Nd}_{0.53} \mathrm{Sr}_{0.47} \mathrm{MnO}_{3}$.

## Figures

Fig. 1. The structure of the distorted perovskite $\mathrm{Nd}_{0.53} \mathrm{Sr}_{0.47} \mathrm{MnO}_{3}$ with displacement ellipsoids drawn at the $90 \%$ probability level.

Fig. 2. The difference density map projected onto (010) plane with a range $0<x<1$ and $0<z$ $<1 / 2$. (a): The $x$-coordinate of O 1 is $>1 / 2$. (b): The $x$-coordinate of O 1 is $<1 / 2$. Contours are given at intervals of $0.5 \mathrm{e} \AA^{-3}$. Zero contours are drawn as thick lines, positive contours are drawn as thin lines, and negative contours are drawn as broken line.

Refinement. B—C anisotropic typel extinction parameters ( $\times 10^{4}$ s) are as follows 4087 (526) 6631 (1159) 3088 (391) -790 (416) 1835 (361) 3716 (625)

Dawson et al. (1967) proposed the treatment of temperature factors including anharmonic thermal vibration (AHV) effect for highsymmetry crystals by means of series expansion of an one-particle-potential. Tanaka and Marumo (1983) generalized the treatment and anharmonic third and fourth order parameters were refined in the least-square program. AHV parameters were restricted by the site symmetry of $\mathrm{Nd} / \mathrm{Sr}(2 \mathrm{~mm}), \mathrm{Mn}(.2 / \mathrm{m}),. \mathrm{O}(2 \mathrm{~mm})$ and $\mathrm{O} 2(. .2)$. The anharmonic potentials $(\mathrm{V})$ are represented by the following equation:

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{Nd}, \mathrm{Sr}, \mathrm{O} 1}=\mathrm{c}_{111} \mathrm{u}_{1}{ }^{3}+\mathrm{c}_{123} \mathrm{u}_{1} \mathrm{u}_{2}{ }^{2}+\mathrm{c}_{133} \mathrm{u}_{1} \mathrm{u}_{3}{ }^{2}+\mathrm{q}_{1111} \mathrm{u}_{1}{ }^{4}+\mathrm{q}_{1122} \mathrm{u}_{1}{ }^{2} \mathrm{u}_{2}{ }^{2}+\mathrm{q}_{1133} \mathrm{u}_{1}{ }^{2} \mathrm{u}_{3}{ }^{2}+\mathrm{q}_{2222} \mathrm{u}_{2}{ }^{4}+\mathrm{q}_{2233} \mathrm{u}_{2}{ }^{2} \mathrm{u}_{3}{ }^{2}+\mathrm{q}_{3333} \mathrm{u}_{3}{ }^{4} \cdots(1) \\
& \mathrm{V}_{\mathrm{Mn}}=\mathrm{q}_{1111} \mathrm{u}_{1}{ }^{4}+\mathrm{q}_{1122} \mathrm{u}_{1}{ }^{2} \mathrm{u}_{2}{ }^{2}+\mathrm{q}_{1133} \mathrm{u}_{1}{ }^{2} \mathrm{u}_{3}{ }^{2}+\mathrm{q}_{2222} \mathrm{u}_{2}{ }^{4}+\mathrm{q}_{2233} \mathrm{u}_{2}{ }^{2} \mathrm{u}_{3}{ }^{2}+\mathrm{q}_{3333} \mathrm{u}_{3}{ }^{4}+\mathrm{q}_{1131} \mathrm{u}_{1}{ }^{3} \mathrm{u}_{3}+\mathrm{q}_{2231} \mathrm{u}_{2}{ }^{2} \mathrm{u}_{1} \mathrm{u}_{3}+\mathrm{q}_{3331} \mathrm{u}_{3}{ }^{3} \mathrm{u}_{1} \cdots(2) \\
& \mathrm{V}_{\mathrm{O} 2}=\mathrm{c}_{211} \mathrm{u}_{1}{ }^{2} \mathrm{u}_{2}+\mathrm{c}_{222} \mathrm{u}_{2}{ }^{3}+\mathrm{c}_{233} u_{3}^{2} \mathrm{u}_{2}+\mathrm{c}_{123} u_{1} u_{2} u_{3}+q_{1111} u_{1}^{4}+q_{1122} u_{1}{ }^{2} u_{2}{ }^{2}+q_{1133} u_{1}^{2} u_{3}^{2}+q_{2222} u_{2}^{4}+q_{2233} u_{2}^{2} u_{3}^{2}+q_{3333} u_{3}^{4}+q_{1131} u_{1}{ }^{3} u_{3} \\
& +q_{2231} u_{2}{ }^{2} u_{1} u_{3}+q_{3331} u_{3}{ }^{3} u_{1} \cdots(3)
\end{aligned}
$$

where ( $\mathrm{u}_{1}, \mathrm{u}_{2}, \mathrm{u}_{3}$ ) is a displacement vector from equilibrium position of each atom. The displacement vector of $\mathrm{Nd}, \mathrm{Sr}, \mathrm{O} 1$ was defined on the coordinate system with axes parallel to the crystal axes, $\mathrm{a}, \mathrm{b}$ and c . That of Mn and O 2 was defined by equation (4) and (5) in terms of the lattice vectors $\mathrm{a}, \mathrm{b}$ and c in the present study.

$$
\begin{aligned}
& \mathrm{u}_{1}=-0.18253 a, \mathrm{u}_{2}=0.18413 b, \mathrm{u}_{3}=-0.13157 c \cdots(4) \\
& \mathrm{u}_{1}=-0.11080 a-0.14633 b, \mathrm{u}_{2}=0.13157 c, \mathrm{u}_{3}=-0.14506 a+0.11177 b \cdots(5)
\end{aligned}
$$

Since there is strong correlation between harmonic temperature factors and AHV parameters, the AHV parameters and the harmonic temperature factors were refined alternately. The significant AHV parameters $\mathrm{c}_{\mathrm{ijk}}\left(\times 10^{-19} \mathrm{~J} \AA^{-3}\right)$ and $q_{i i j k}\left(\times 10^{-19} \mathrm{~J} \AA^{-3}\right)$ are as follows:
