Received 8 August 2008; accepted 22 October 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.006 \text{ \AA}$; R factor = 0.027; wR factor = 0.071; data-to-parameter ratio = 13.1.

The title complex, $[\text{Cd}(\text{C}_{14}\text{H}_{11}\text{N}_2\text{O}_4)_2(\text{C}_5\text{H}_5\text{N})_2]$, exhibits crystallographic twofold symmetry. The Cd^{II} atom is located on the twofold rotation axis and reveals a slightly distorted octahedral coordination defined by four atoms (N_2O_2) from two symmetry-related chelate ligands and two pyridine N atoms. Intramolecular O—H···O and N—H···O hydrogen bonds stabilize the molecular conformation while intermolecular O—H···O hydrogen bonding links molecules into a triad, generating a helix along the threefold screw axis.

Related literature

Three manganese metallacrowns with unsymmetrical arylhydrazine ligands were synthesized and reported by Dou *et al.* (2006) and John *et al.* (2006). For the crystal structure of an iron compound with *N,N'*-bis-picolinoyl hydrazine, see: Bernhardt *et al.* (2005). For a nickel complex formed by *N,N'*-disalicyloylhydrazine, see: Chen *et al.* (2007).

Bis[2-hydroxy-*N'*-(2-hydroxybenzoyl)benzohydrazitato]dipyridinecadmium(II)

Y.-T. Chen and D.-C. Li

Comment

Metal complexes with arylhydrazine ligands are of increasing attention due to their interesting chemical activities (John *et al.* 2006; Dou *et al.*, 2006). However, the research on the compounds with symmetrical diarylhydrazine ligands was limited (Bernhardt *et al.*, 2005; Chen *et al.*, 2007). As an extension of our work on the structural characterization of these compounds, the title complex, (I), is synthesized and characterized by X-ray structure analysis. The complex (I) exhibits a twofold rotation symmetry. It comprises of one Cd^{II} atom at special position at the twofold rotation axes coordinated by two ligands and two pyridines (Fig. 1 and Table 1). Each ligand acts as the bidentate via the iminoacyl groups forming two five-membered rings around metal ion with the dihedral angle of 59.71 (4)^o.

Intramolecular O4—H4···O3 and N2—H2···O2 hydrogen bonds stabilizes the molecular conformation. There is also an intermolecular hydrogen bond O—H···O hydrogen bond [2.639 (3) Å] (Table 2) assembling three molecules into a triad, that is a basic structural element of a helix along [0 0 1] direction (Fig. 2).

Experimental

The solution of Cd(NO₃)₂·4H₂O (0.123 g, 0.4 mmol) in methanol (10 mL) was added to the mixture of 1,2-disalicyloylhydrazine (0.054 g, 0.2 mmol) and sodium hydroxide (0.032 g, 0.8 mmol) in pyridine (10 mL). A colourless solution was generated after stirring for two hours at room temperature. The solution was allowed to stand for 2 weeks, whereupon white block crystals were obtained. Yield: 0.058 g, 77%. m. p.> 573 K. Anal. for C₃₈H₃₂CdN₆O₈: Calc. C, 56.08; H, 3.93; N, 10.33; Found: C, 56.54; H, 3.71; N, 10.54%. The No. of CCDC: 686345.

Refinement

All H atoms were placed in geometrically idealized positions and treated as riding on their parent atoms with C(sp₂ hybrid)-H distances of 0.93 Å ($U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$).

Figures

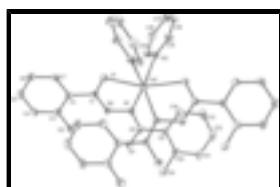

Fig. 1. The molecular structure of the title complex. Displacement ellipsoids are drawn at the 30% probability level.

241 parameters	$\Delta\rho_{\text{min}} = -0.32 \text{ e \AA}^{-3}$
	Extinction correction: none

Primary atom site location: structure-invariant direct methods Absolute structure: Flack (1983), 1353 Friedel pairs
 Secondary atom site location: difference Fourier map Flack parameter: -0.06 (3)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
