Received 22 September 2008; accepted 27 September 2008

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.043; wR factor = 0.118; data-to-parameter ratio = 16.1.

The asymmetric unit of the title compound, $\text{C}_8\text{H}_{14}\text{N}_2^{2+}\cdot 2\text{Cl}^-$, contains one and a half of the dications and three chloride anions. The half molecule is completed by crystallographic twofold symmetry with two C atoms lying on the rotation axis. The two ammonium groups in each cation adopt a *trans* conformation with respect of the benzene ring. The ammonium groups and chloride anions are involved in the formation of a three-dimensional $\text{N}-\text{H}\cdots\text{Cl}$ hydrogen-bonding network, which stabilizes the crystal packing.

(*m*-Phenylenedimethylene)diammonium dichloride

H. Cheng and H. Li

Comment

The diamine compounds are important in biologically active natural products (Pasini & Zunino, 1987; Otsuka *et al.*, 1990), in medicinal chemistry (Michalson & Smuszkovicz, 1989; Reedijk, 1996). They are also used as chiral auxiliaries and chiral ligands in asymmetric catalysis (Blaser, 1992; Soai & Niwa, 1992; Jacobsen, 1993; Kolb *et al.*, 1994). Herewith we present the title diamine compound, (I).

In (I) (Fig. 1), all bond lengths and angles are normal. Two amino groups in the dications adopt trans-conformation and each amino group form three N—H···Cl hydrogen bonds (Table 1) to stabilize the crystal packing.

Experimental

1,3-Phenylenedimethanamine was dissolved in ethanol, then 1N HCl was dropped to the solution. Colourless, block-like crystals of (I) suitable for X-ray data collection were obtained by slow evaporation of ethanol at 283 K.

Refinement

All H atoms were initially located in a difference Fourier map. C-bound H atoms were placed in idealized positions (C—H = 0.93–0.97 Å) and refined as riding, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. Amino H atoms were refined with bond restraint of N—H = 0.88 (3) Å and constrained displacement parameter $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$.

Figures

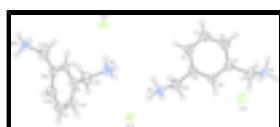

Fig. 1. View of (I) showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented by spheres of arbitrary radius.

(*m*-Phenylenedimethylene)diammonium dichloride

Crystal data

$F_{000} = 1320$

$M_r = 209.11$

$D_x = 1.337 \text{ Mg m}^{-3}$

Monoclinic, $C2/c$

Mo $K\alpha$ radiation

$\lambda = 0.71073 \text{ \AA}$

Hall symbol: -c/2yc

Cell parameters from 6157 reflections

$a = 27.5859 (18) \text{ \AA}$

$\theta = 2.8\text{--}27.8^\circ$

$b = 13.1594 (14) \text{ \AA}$

$\mu = 0.58 \text{ mm}^{-1}$

supplementary materials

$c = 8.8324 (6)$ Å	$T = 298 (2)$ K
$\beta = 103.539 (1)^\circ$	Block, colourless
$V = 3117.2 (4)$ Å ³	$0.20 \times 0.10 \times 0.10$ mm
$Z = 12$	

Data collection

Bruker SMART CCD area-detector diffractometer	3066 independent reflections
Radiation source: fine-focus sealed tube	2615 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.103$
$T = 298(2)$ K	$\theta_{\text{max}} = 26.0^\circ$
φ and ω scans	$\theta_{\text{min}} = 1.5^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1997)	$h = -33 \rightarrow 33$
$T_{\text{min}} = 0.894$, $T_{\text{max}} = 0.945$	$k = -14 \rightarrow 16$
14623 measured reflections	$l = -10 \rightarrow 10$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.043$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.118$	$w = 1/[\sigma^2(F_o^2) + (0.0717P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\text{max}} = 0.001$
3066 reflections	$\Delta\rho_{\text{max}} = 0.36$ e Å ⁻³
191 parameters	$\Delta\rho_{\text{min}} = -0.31$ e Å ⁻³
9 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
