Received 27 September 2008; accepted 17 October 2008

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.029; wR factor = 0.076; data-to-parameter ratio = 7.0.

The asymmetric unit of the title compound, $\text{C}_{17}\text{H}_{17}\text{N}_2\text{O}_2^+\cdot\text{Cl}^-\cdot\text{H}_2\text{O}$, contains one-half of the cation, one-half of a water molecule and a chloride anion. The complete cation is generated by crystallographic two-fold symmetry, with one C atom lying on the rotation axis. The O and Cl atoms have site symmetry 2. The imidazolidium ring is oriented at a dihedral angle of $4.15(3)^\circ$ with respect to the 4-methoxyphenyl ring and an intramolecular $\text{C}-\text{H}\cdots\text{O}$ interaction occurs. In the crystal structure, intermolecular $\text{O}-\text{H}\cdots\text{Cl}$ and $\text{C}-\text{H}\cdots\text{Cl}$ hydrogen bonds link the molecules. There is a $\pi-\pi$ contact between the imidazolidium and 4-methoxyphenyl rings [centroid-to-centroid distance = $3.625(3)\text{ \AA}$]. There is also a $\text{C}-\text{H}\cdots\pi$ contact between the methyl group and the 4-methoxyphenyl ring.

1,3-Bis(4-methoxyphenyl)imidazolidium chloride monohydrate

Y. Wan, H. Xin, X. Chen, H. Xu and H. Wu

Comment

Imidazole and its derivatives such as imidazolium cation are important compounds playing important roles in medical, organic and material chemistry (Lin & Vasam, 2005). A broad application of imidazolium now is to synthesize ionic liquids. Recently, ionic liquids are attracting much attention as alternative reaction media for synthesis and catalysis. Its applications in many different areas including separation processes, catalyst, electrochemistry, electrolytes in solar cells and lubricants are widely recognized. Therefore, the need of ionic liquids with specific chemical and physical properties become stronger. We report herein the synthesis and crystal structure of the title compound.

The asymmetric unit of the title compound (Fig. 1) contains one half-molecule, one half-water molecule and a chloride atom. The bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Rings A (N1/N1'/C1/C2/C2') and B (C3–C8) are, of course, planar and the dihedral angle between them is A/B = 4.15 (3)° [symmetry code: (') -x, y, -z]. Intramolecular C—H···O and O—H···Cl hydrogen bonds (Table 1) link the molecules.

In the crystal structure, intramolecular C—H···O and O—H···Cl and intermolecular C—H···Cl hydrogen bonds (Table 1) link the molecules (Fig. 2), in which they may be effective in the stabilization of the structure. The π — π contact between the imidazolidium and 4-methoxyphenyl rings, Cg1···Cg2ⁱ [symmetry code: (i) 1 - x, y, 1 - z, where Cg1 and Cg2 are the centroids of the rings A (N1/N1'/C1/C2/C2') and B (C3–C8), respectively] may further stabilize the structure, with centroid-centroid distance of 3.625 (3) Å. There also exist a C—H··· π contact (Table 1) between the methyl group and the 4-methoxyphenyl ring.

Experimental

The reaction of 4-methoxybenzenamine (2 mmol) with formaldehyde (aq. 37%, 1 mmol) and glyoxal (aq. 40%, 1 mmol) in ethanol (95%) at 273–278 K for 8 h afforded 1-(2,3-diethoxy-4-(4-methoxyphenyl)cyclopentyl)-4-methoxybenzene (yield; 89%). The title compound was obtained through the oxidation of 1-(2,3-diethoxy-4-(4-methoxyphenyl)cyclopentyl)-4-methoxybenzene by phosgene in DMF at 268–273 K (yield 95%).

Refinement

H atoms were positioned geometrically, with O—H = 0.85 Å (for H₂O) and C—H = 0.93 and 0.96 Å for aromatic and methyl H, respectively, and constrained to ride on their parent atoms with U_{iso}(H) = xU_{eq}(C,O), where x = 1.5 for methyl H and x = 1.2 for all other H atoms.

Data collection

Bruker SMART CCD area-detector diffractometer	749 independent reflections
Radiation source: fine-focus sealed tube	688 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.021$
$T = 298(2) \text{ K}$	$\theta_{\text{max}} = 25.0^\circ$
φ and ω scans	$\theta_{\text{min}} = 2.5^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -18 \rightarrow 13$
$T_{\text{min}} = 0.951, T_{\text{max}} = 0.977$	$k = -9 \rightarrow 11$
2026 measured reflections	$l = -6 \rightarrow 6$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.029$	H-atom parameters constrained

$wR(F^2) = 0.076$	$w = 1/[\sigma^2(F_o^2) + (0.0503P)^2 + 0.1521P]$
	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{\max} < 0.001$
749 reflections	$\Delta\rho_{\max} = 0.11 \text{ e } \text{\AA}^{-3}$
107 parameters	$\Delta\rho_{\min} = -0.22 \text{ e } \text{\AA}^{-3}$
1 restraint	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
