In the title complex, $[Fe_2Cl_2(C_{11}H_{16}N_4)_4][FeCl_4]_2$, the asymmetric unit is composed of one and a half units of $[Fe(bdmpm)_2Cl]_2(FeCl_4)_2$ ($bdmpm =$ bis(bis(3,5-dimethylpyrazol-1-yl)methane). The three independent Fe^{II} atom have a distorted octahedral coordination geometry comprising two bridging chloride anions and four N atoms from two bis(3,5-dimethylpyrazol-1-yl)methane ligands. The Fe^{III} atom has a tetrahedral coordination geometry comprising four chloride anions.

Comment

The various unsubstituted and methyl-substituted poly-(pyrazolyl)methane ligands have become very important in coordination chemistry (Pettinari, *et al.*, 2005; Reger, *et al.*, 2004; Higgs, *et al.*, 1999; Anderson, *et al.*, 2000; Edwards, *et al.*, 2006). But most of them are coordinated with iron to form single nuclear coordination complexes, only few examples are binuclear coordination complexes (Gu, *et al.*, 2006; Batten, *et al.*, 2004; Moubaraki, *et al.*, 2003). In the crystal of the title complex, the asymmetric unit is composed of one and a half units of $[\text{Fe}(\text{bdmpm})_2\text{Cl}]_2 \cdot 2\text{FeCl}_4$ (bdmpm = bis(bis(3,5-dimethylpyrazol-1-yl)methane). One of $[\text{Fe}(\text{bdmpm})_2\text{Cl}]_2$ complexes has a crystallographic center of symmetry, the other has an approximate center of symmetry but it is not crystallographic. The reason for this difference is that the bond length and bond angles around Fe(2) and Fe(3) are slightly different. Each binuclear cations with a pair of bridging chloride ligands and the two bmmppm ligands results in six-coordination about each of the metal atoms; the environments of the complex are octahedron geometry (Fig. 1).

Experimental

The reaction of $\text{FeCl}_2 \cdot 4\text{H}_2\text{O}$ (20 mg, 0.1 mmol) with bdmpm (44 mg, 0.22 mmol) in EtOH (15 ml) was carried out at ambient temperature for 20 minutes, the mixture was filtered and the filtrate was then left for crystallization.

Refinement

In this structure, the C-H distance was constrained to 0.93 Å for C-H, 0.96 Å for C-H₃ and 0.97 for C-H₂. The ratio of the Uiso values 1.2 for H atoms of C-H and C-H₂, 1.5 for H atoms of C-H₃.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
