Received 16 November 2008; accepted 24 November 2008

Key indicators: single-crystal X-ray study;  $T = 291$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å; disorder in main residue;  $R$  factor = 0.037; wR factor = 0.099; data-to-parameter ratio = 14.0.

In the title compound,  $[\text{Fe}(\text{C}_5\text{H}_5)(\text{C}_{11}\text{H}_{10}\text{NO})]$ , the dihedral angle between the pyridyl and substituted cyclopentadienyl rings is  $20.4(3)^\circ$ . The H atoms of the methyl group are disordered over two positions; their site-occupation factors were fixed at 0.5. The crystal structure is stabilized by well defined intermolecular O—H···N and C—H···O hydrogen bonds, leading to the formation of a two-dimensional network parallel to (101).

## 2-Ferrocenyl-6-methylpyridin-3-ol

Z.-Q. Wang, C. Xu, F.-F. Cen, Y.-F. Li and B.-M. Ji

### Comment

Since the discovery of ferrocene in the 1950's (Kealy & Pauson, 1951), the fascinating structural properties of ferrocene and its derivatives have been the subject of increasing interest in all fields of organometallic chemistry (Hayashi *et al.*, 1995; Staveren *et al.*, 2004; Xu *et al.*, 2007). Among them, ferrocene-heterocycles are one of the most important ones (Sarhan & Izumi, 2003). Herein we report the crystal structure of the title compound.

A view of the molecular structure of the title compound is given in Fig.1. The hydrogen atoms of methyl groups are disordered; site-occupation factors were fixed at 0.5. The pyridyl and Cp ring form a dihedral angle of 20.4 (3)°. In the crystal of the title compound, intermolecular O—H···N and C—H···O hydrogen bonds are present (Table 1), resulting in a two-dimensional supramolecular architecture (Fig.2).

### Experimental

The title compound was prepared as described in literature (Beletskaya *et al.*, 2001) and recrystallized from dichloromethane-petroleum ether solution at room temperature to give the desired product as red crystals suitable for single-crystal X-ray diffraction.

### Refinement

H atoms attached to C atoms of the title compound were placed in geometrically idealized positions and treated as riding with C—H distances constrained to 0.93–0.96 Å, and with  $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$  (1.5  $U_{\text{eq}}$  for methyl H).

### Figures

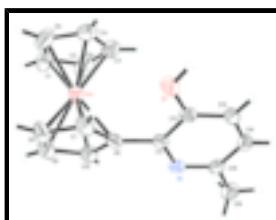

Fig. 1. The molecular structure of the title compound with displacement ellipsoids at the 30% probability level. Only one disordered component of the methyl group is shown.

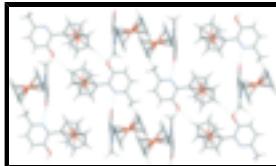

Fig. 2. Partial view of the crystal packing showing the intermolecular O—H···N and C—H···O hydrogen bonds. One disordered component of the methyl group has been omitted for clarity.

### Crystal data

[Fe(C <sub>5</sub> H <sub>5</sub> )(C <sub>11</sub> H <sub>10</sub> NO)]	$F_{000} = 608$
$M_r = 293.14$	$D_x = 1.491 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation
Hall symbol: -P 2yn	$\lambda = 0.71073 \text{ \AA}$
$a = 10.4370 (13) \text{ \AA}$	Cell parameters from 2766 reflections
$b = 12.7196 (15) \text{ \AA}$	$\theta = 2.4\text{--}25.0^\circ$
$c = 10.5424 (13) \text{ \AA}$	$\mu = 1.14 \text{ mm}^{-1}$
$\beta = 111.0330 (10)^\circ$	$T = 291 (2) \text{ K}$
$V = 1306.3 (3) \text{ \AA}^3$	Block, red
$Z = 4$	$0.37 \times 0.23 \times 0.21 \text{ mm}$

### Data collection

Bruker SMART APEX CCD diffractometer	2422 independent reflections
Radiation source: fine-focus sealed tube	1970 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.021$
$T = 291(2) \text{ K}$	$\theta_{\text{max}} = 25.5^\circ$
$\varphi$ and $\omega$ scans	$\theta_{\text{min}} = 2.4^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -10 \rightarrow 12$
$T_{\text{min}} = 0.675$ , $T_{\text{max}} = 0.794$	$k = -15 \rightarrow 15$
7569 measured reflections	$l = -12 \rightarrow 12$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.099$	$w = 1/[\sigma^2(F_o^2) + (0.046P)^2 + 0.7167P]$
$S = 1.09$	where $P = (F_o^2 + 2F_c^2)/3$
2422 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
173 parameters	$\Delta\rho_{\text{max}} = 0.63 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.54 \text{ e \AA}^{-3}$
	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes)

are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and

goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based

on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of

$F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is

not relevant to the choice of reflections for refinement.  $R$ -factors based

on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -

factors based on ALL data will be even larger.
