Received 20 November 2008; accepted 25 November 2008

Key indicators: single-crystal X-ray study; $T = 273\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.027; wR factor = 0.072; data-to-parameter ratio = 13.0.

In the title compound, $[\text{Ni}(\text{C}_{20}\text{H}_{22}\text{N}_2\text{O}_4)]\cdot\text{H}_2\text{O}$, the Ni^{II} ion and the water molecule are located on a twofold rotation axis. The Ni ion is coordinated by two N [$\text{Ni}-\text{N} = 1.8462(18)\text{ \AA}$] and two O [$\text{Ni}-\text{O} = 1.8645(14)\text{ \AA}$] atoms in a distorted square-planar geometry. The water molecule and the Ni complex molecule are paired via $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds.

{6,6'-Diethoxy-2,2'-[ethylenebis(nitrilomethylidyne)]diphenolato}nickel(II) monohydrate

H. Xie

Comment

Schiff-bases have played an important role in the development of coordination chemistry as they readily form stable complexes with most of the transition metals, in which some could exhibit interesting properties (Yu *et al.*, 2007; Ghosh *et al.*, 2006; Singh *et al.*, 2007; Samanta *et al.*, 2007). Herein we report a new Ni^{II} complex based on the tetradentate Schiff-base ligand *N,N'*-ethylenebis(3-ethoxysalicylaldimine).

The geometry and labeling scheme for the title compound are depicted in Figure 1. The coordination sphere for the Ni^{II} ion in the title complex is a slightly distorted square planar, in which the four positions are occupied by two N and two O atoms of the Schiff-base ligand. The mean deviation from the plane formed by the two N atoms, two O atoms and the Ni ion is only 0.025 Å. The bond lengths of Ni—N and Ni—O are 1.8462 (18) and 1.8645 (14) Å, respectively, which are consistent with the corresponding distances in 6,6'-dimethoxy-2,2'-(ethane-1,2-diylbis(nitrilomethylidyne)diphenolato)-nickel(II) (Yu, 2006). The crystalline water molecule and Ni-complex are paired *via* O—H···O hydrogen bonds (Table 1, Fig. 1).

Experimental

The Schiff base ligand H₂L (H₂L= *N,N'*-ethylenebis(3-ethoxysalicylaldimine)) was prepared according to the reported method (Mohanta, *et al.*, 2002). The synthesis of the title complex was carried out by reacting Ni(CH₃COO)₂·4H₂O, and H₂L with the molar ratio 1:1 in methanol. After the stirring process was continued for about 30 min at room temperature, the mixture was filtered and the filtrate was allowed to partial evaporate in air for several days to produce crystals suitable for X-ray diffraction.

Refinement

C-bound H atoms were placed in calculated positions, with C—H distances of 0.93 and 0.97 Å, respectively. Atom H3A was located on a difference Fourier map, but placed in idealized position with O—H = 0.82 Å. All H atoms were refined in riding model approximation, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{O})$.

Figures

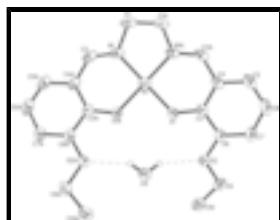

Fig. 1. View of the title compound with the atom-labelling scheme [symmetry code: (A) $-x + 1, y, -z + 1/2$]. Displacement ellipsoids are drawn at the 30% probability level. Dashed lines denote H-bonds. C-bound H-atoms omitted for clarity.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.027$	H-atom parameters constrained
$wR(F^2) = 0.072$	$w = 1/[\sigma^2(F_o^2) + (0.0307P)^2 + 0.9816P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{\text{max}} < 0.001$
1676 reflections	$\Delta\rho_{\text{max}} = 0.33 \text{ e \AA}^{-3}$
129 parameters	$\Delta\rho_{\text{min}} = -0.41 \text{ e \AA}^{-3}$
1 restraint	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
