Received 17 October 2008; accepted 30 October 2008

Key indicators: single-crystal X-ray study;  $T = 113\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.034;  $wR$  factor = 0.085; data-to-parameter ratio = 15.3.

The title compound,  $C_7H_9N_3O_2$ , was prepared by alkaline hydrolysis of ethyl 1-allyl-3-amino-1*H*-pyrazole-4-carboxylate. The crystal structure is stabilized by three types of intermolecular hydrogen bond ( $\text{N}-\text{H}\cdots\text{O}$ ,  $\text{N}-\text{H}\cdots\text{N}$  and  $\text{O}-\text{H}\cdots\text{N}$ ).

### 1-Allyl-3-amino-1H-pyrazole-4-carboxylic acid

G.-C. Li, L.-Y. Wang, R. Zhu and F.-L. Yang

#### Comment

Pyrazole ring derivatives are very important substances in biology and have many application in the field of pesticide and pharmaceutical agents (Malhotra *et al.*, 1997; Takao *et al.*, 1994). Some of these compounds such as pyrazosulfuron have been sold as agrochemicals (Wang *et al.*, 2005).

Here we report the synthesis and crystal structure of the title compound, 1-allyl-3-amino-1H-pyrazole-4-carboxylic acid (Fig. 1). The crystal packing (Fig. 2) is stabilized by the intermolecular hydrogen bonds (Fig. 2 & Table 1).

#### Experimental

The mixture of ethyl 1-allyl-3-amino-1H-pyrazole-4-carboxylate (1.95 g, 10 mmol) in THF-MeOH (50 ml, v/v = 1/1) with 2.5N NaOH(25 ml) was heated at 333 K for 4 h. The solvent was removed under reduced pressure and the residue was acidified with 6N HCl at 273 K. A gray solid was precipitated, filtered, and washed with water. Single crystals suitable for X-ray diffraction were obtained by recrystallization of the title compound in ethanol.

#### Refinement

H atoms of N1 and O2 were positioned in a difference Fourier maps and their parameters were freely refined. The other H atoms were placed in calculated positions, with C—H = 0.95 or 0.99 Å, and O—H = 0.82 Å, and included in the final cycles of refinement using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

#### Figures

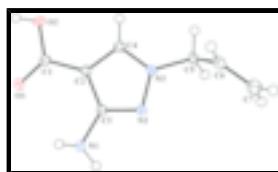

Fig. 1. The molecular structure of the title compound, showing displacement ellipsoids drawn at the 50% probability level.

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.034$	H atoms treated by a mixture of

	independent and constrained refinement
$wR(F^2) = 0.085$	$w = 1/[\sigma^2(F_o^2) + (0.0353P)^2 + 0.3376P]$
	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\max} < 0.001$
1852 reflections	$\Delta\rho_{\max} = 0.29 \text{ e } \text{\AA}^{-3}$
121 parameters	$\Delta\rho_{\min} = -0.25 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
